

E4S: The Extreme-scale Scientific Software Stack for Collaborative Open Source Software

Michael A. Heroux, Sandia National Laboratories
Director of Software Technology, ECP

Sameer Shende, University of Oregon
E4S Technical Lead

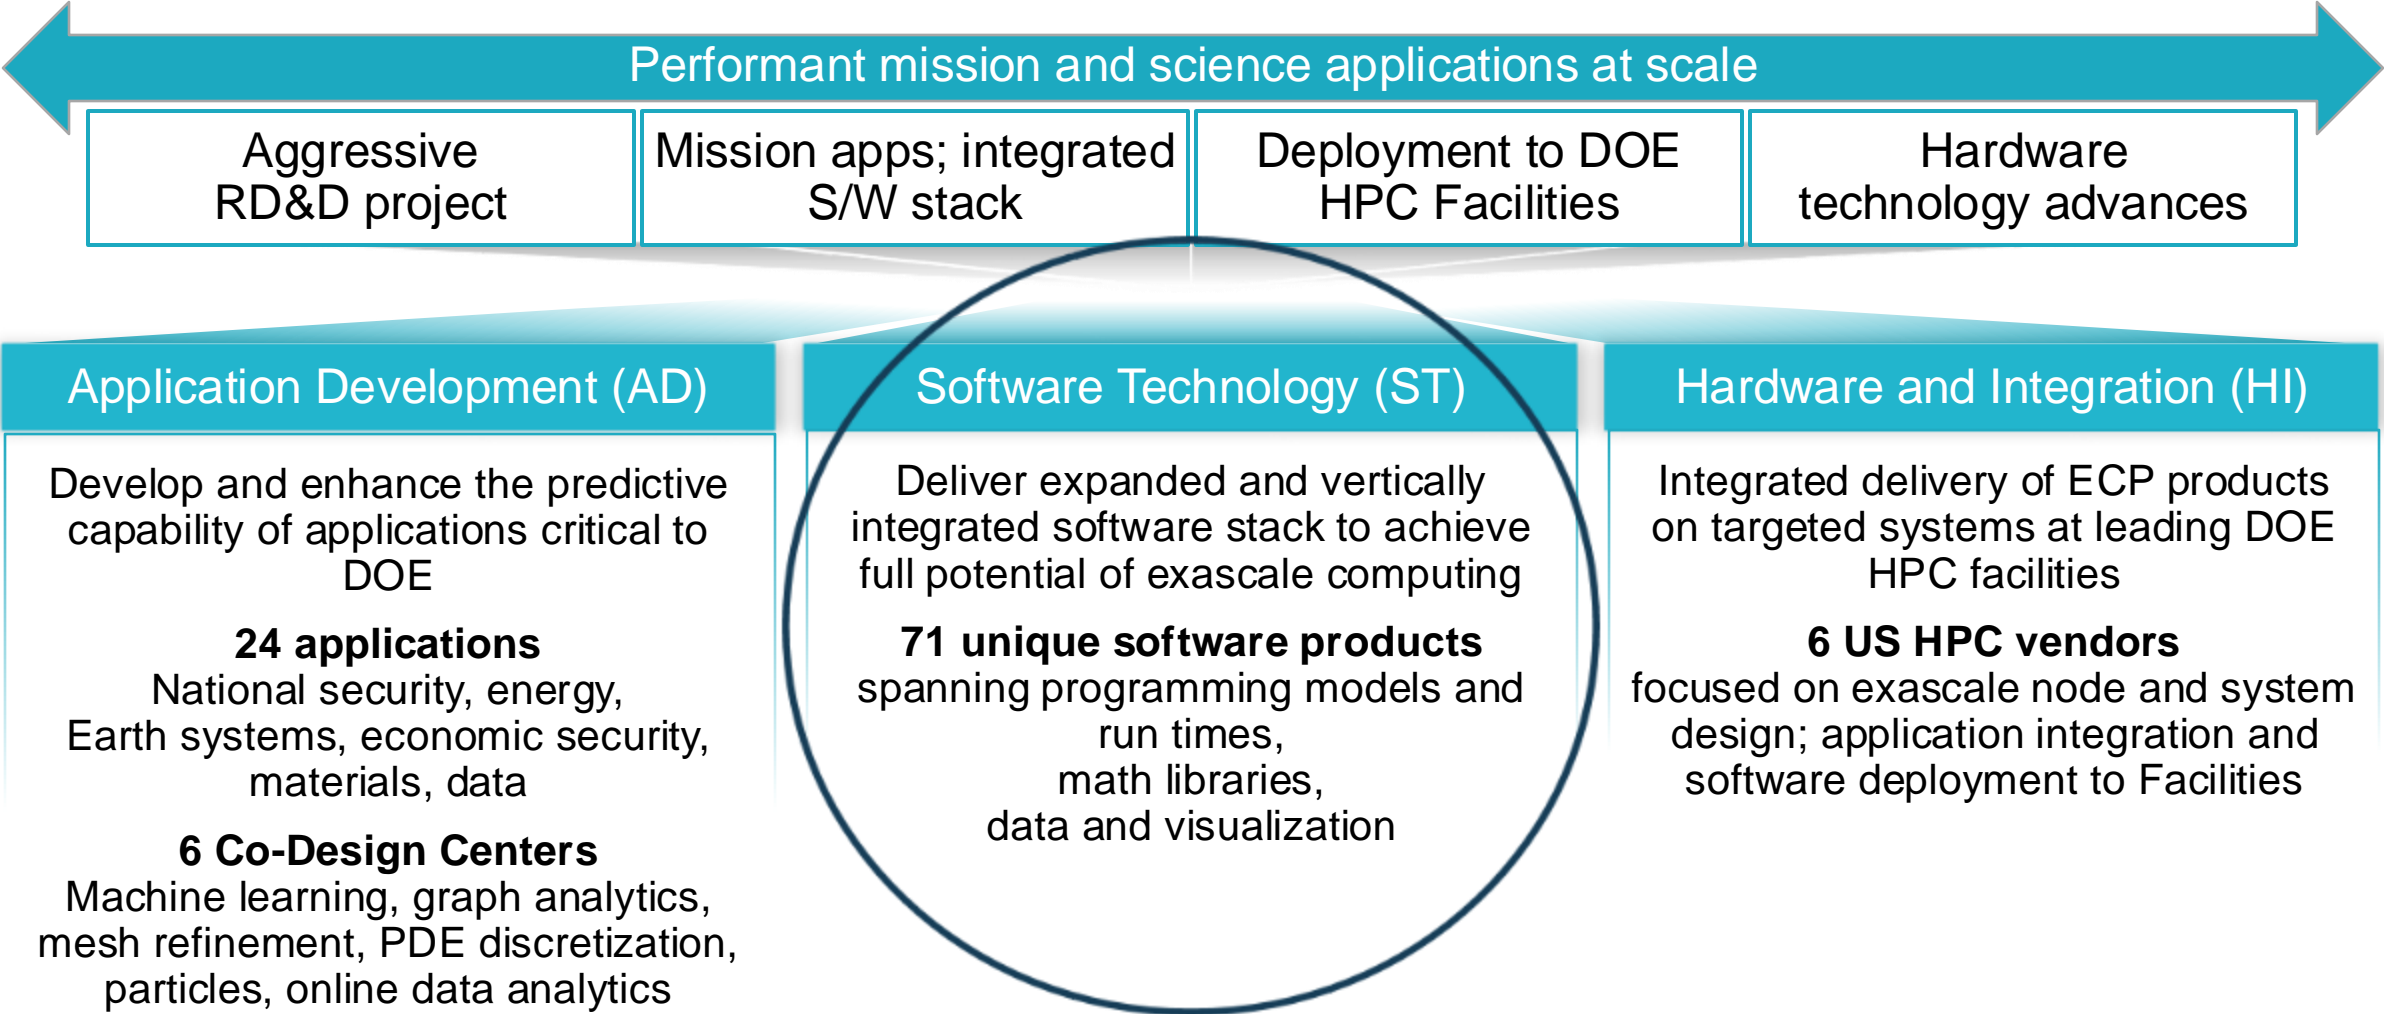

Getting Started with E4S for Industry and Agencies Workshop, June 14, 2021

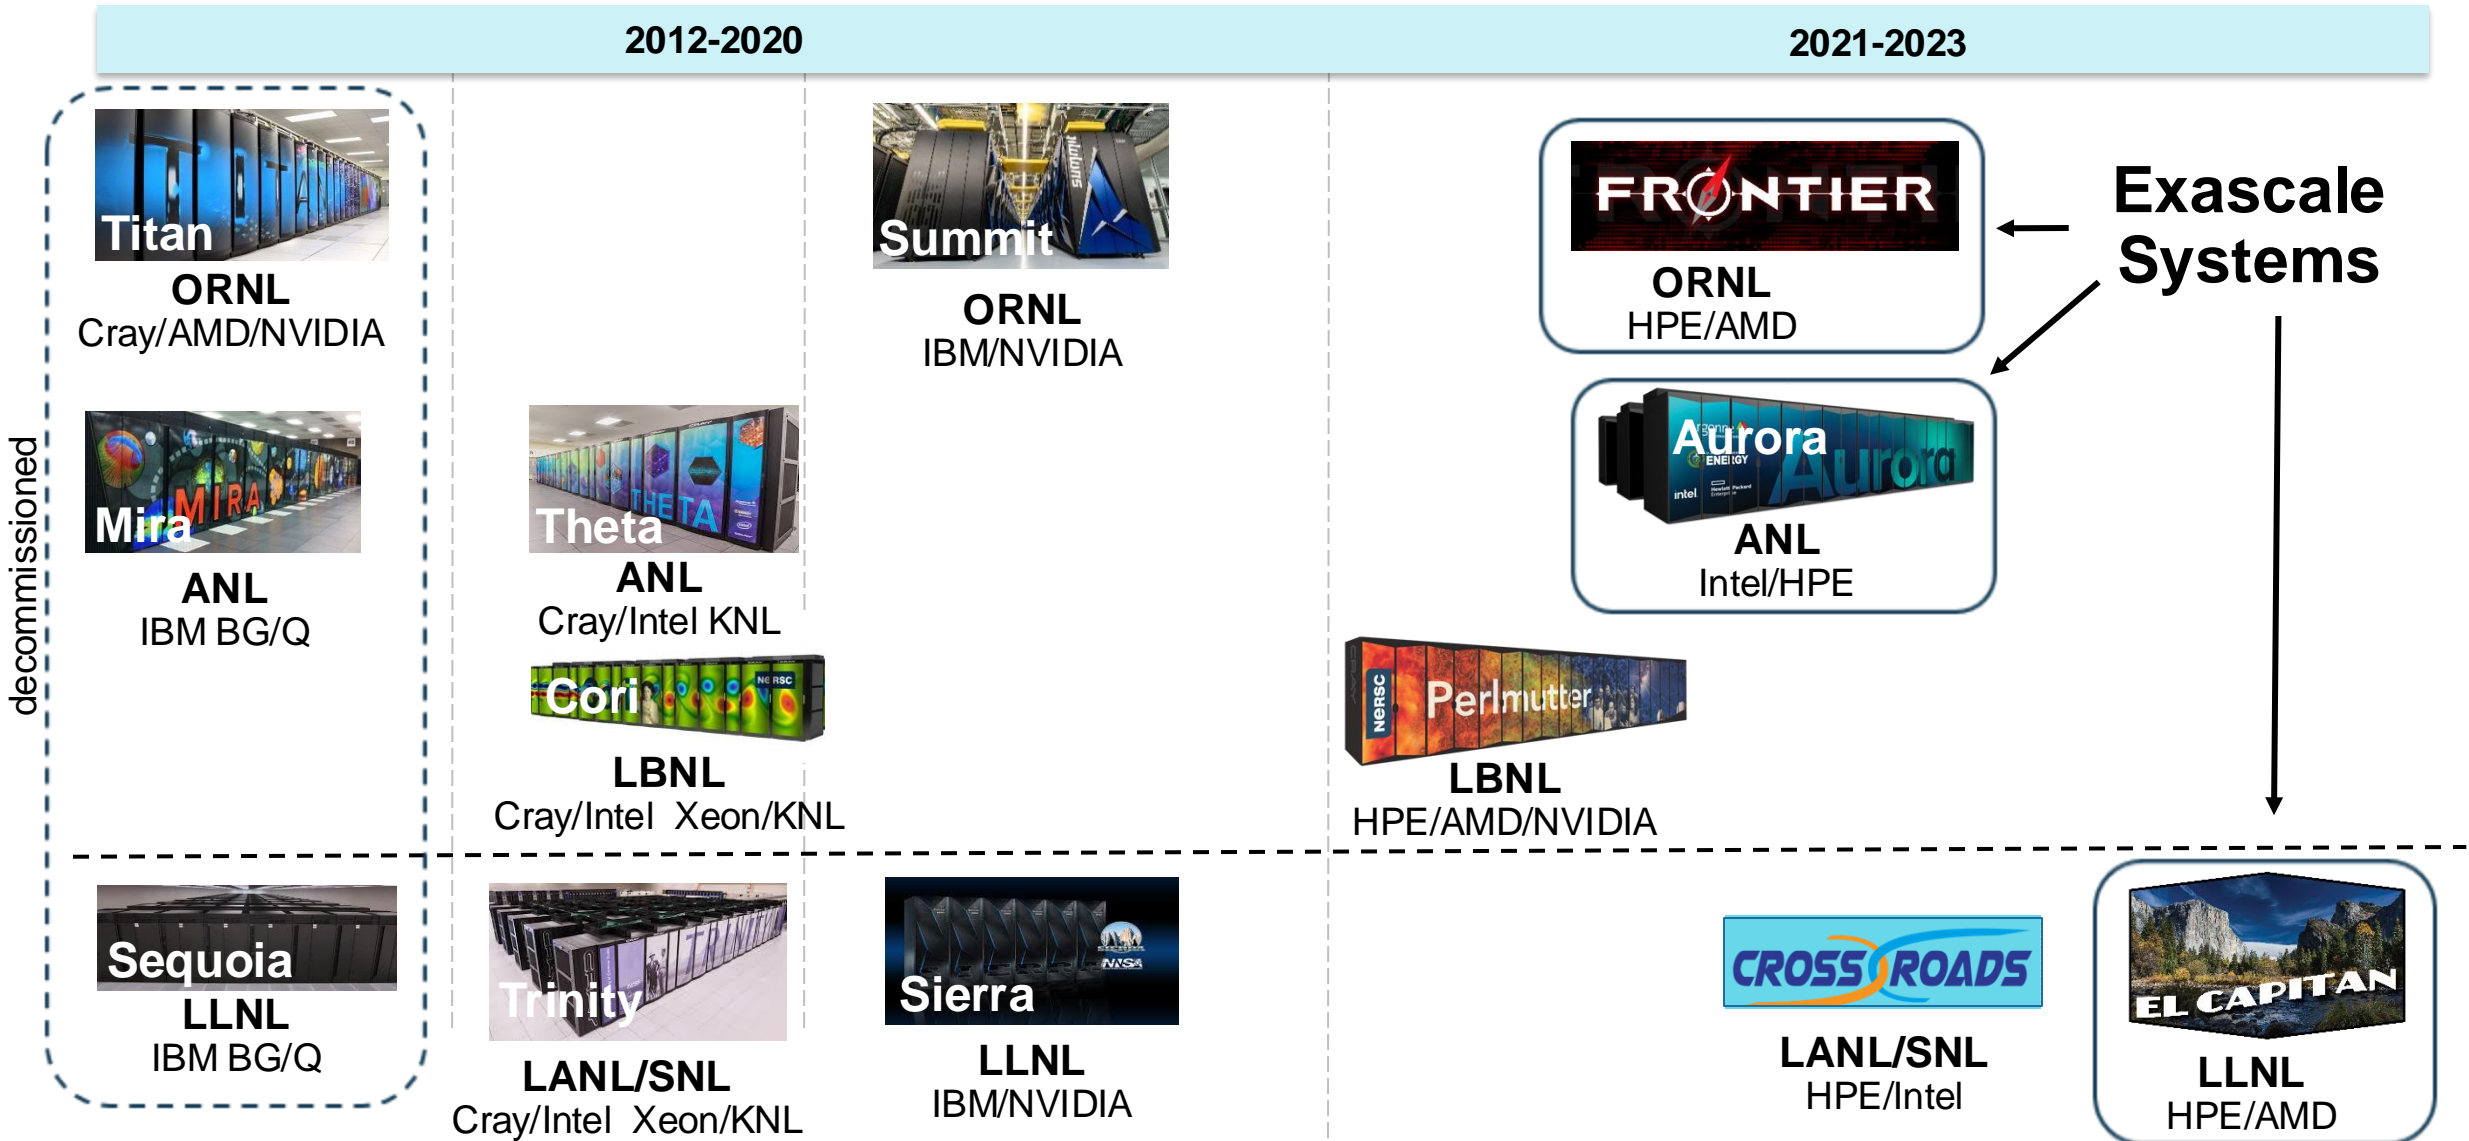

Brief Intro to the Exascale Computing Project (ECP)

ECP's holistic approach uses co-design and integration to achieve exascale computing

DOE HPC Roadmap to Exascale Systems

Brief Intro to ECP Software Technology (ST) Focus Area

ECP Software Technology (ST)

Goal

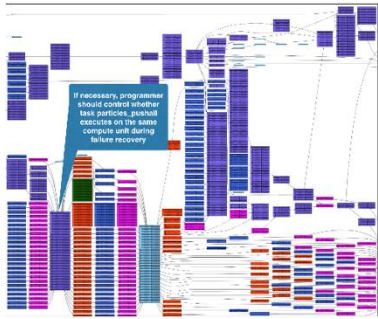

Build a comprehensive, coherent software stack that enables application developers to productively develop highly parallel applications that effectively target diverse exascale architectures

Prepare SW stack for scalability with massive on-node parallelism

Extend existing capabilities when possible, develop new when not

Guide, and complement, and integrate with vendor efforts

Develop and deliver high-quality and robust software products

ECP ST has six technical areas

Programming Models & Runtimes

- Enhance and get ready for exascale the widely used MPI and OpenMP programming models (hybrid programming models, deep memory copies)
- Development of performance portability tools (e.g. Kokkos and Raja)
- Support alternate models for potential benefits and risk mitigation: PGAS (UPC++/GASNet), task-based models (Legion, PaRSEC)
- Libraries for deep memory hierarchy and power management

Development Tools

- Continued, multifaceted capabilities in portable, open-source LLVM compiler ecosystem to support expected ECP architectures, including support for F18
- Performance analysis tools that accommodate new architectures, programming models, e.g., PAPI, Tau

Math Libraries

- Linear algebra, iterative linear solvers, direct linear solvers, integrators and nonlinear solvers, optimization, FFTs, etc
- Performance on new node architectures; extreme strong scalability
- Advanced algorithms for multi-physics, multiscale simulation and outer-loop analysis
- Increasing quality, interoperability, complementarity of math libraries

Data and Visualization

- I/O via the HDF5 API
- Insightful, memory-efficient in-situ visualization and analysis – Data reduction via scientific data compression
- Checkpoint restart

NNSA ST

- Open source NNSA Software projects
- Projects that have both mission role and open science role
- Major technical areas: New programming abstractions, math libraries, data and viz libraries
- Cover most ST technology areas
- Subject to the same planning, reporting and review processes

Software Ecosystem

- Develop features in Spack necessary to support all ST products in E4S, and the AD projects that adopt it
- Development of Spack stacks for reproducible turnkey deployment of large collections of software
- Optimization and interoperability of containers on HPC systems
- Regular E4S releases of the ST software stack and SDKs with regular integration of new ST products

We work on products applications need now and into the future

Key themes:

- Focus: GPU node architectures and advanced memory & storage technologies
- Create: New high-concurrency, latency tolerant algorithms
- Develop: New portable (Nvidia, Intel, AMD GPUs) software product
- Enable: Access and use via standard APIs

Software categories:

- **Next generation established products:** Widely used HPC products (e.g., MPICH, OpenMPI, PETSc)
- **Robust emerging products:** Address key new requirements (e.g., Kokkos, RAJA, Spack)
- **New products:** Enable exploration of emerging HPC requirements (e.g., SICM, zfp, UnifyCR)

Example Products	Engagement
MPI – Backbone of HPC apps	Explore/develop MPICH and OpenMPI new features & standards
OpenMP/OpenACC –On-node parallelism	Explore/develop new features and standards
Performance Portability Libraries	Lightweight APIs for compile-time polymorphisms
LLVM/Vendor compilers	Injecting HPC features, testing/feedback to vendors
Perf Tools - PAPI, TAU, HPCToolkit	Explore/develop new features
Math Libraries: BLAS, sparse solvers, etc.	Scalable algorithms and software, critical enabling technologies
IO: HDF5, MPI-IO, ADIOS	Standard and next-gen IO, leveraging non-volatile storage
Viz/Data Analysis	ParaView-related product development, node concurrency

Progress toward Exascale readiness

SLATE port to AMD and Intel platforms

ECP WBS 2.3.3.13 CLOVER (SLATE)
PI Jack Dongarra, UTK
Members UTK

Scope and objectives

- SLATE is a distributed, GPU-accelerated, dense linear algebra library, intended to replace ScaLAPACK
- SLATE covers parallel BLAS, linear system solvers, least squares, eigensolvers, and the SVD

Impact

- Initially supported NVIDIA's cuBLAS for use on current machines like Summit
- Can now use AMD's rocBLAS in preparation for Frontier, and Intel's oneMKL in preparation for Aurora
- Other projects can also leverage BLAS++ for portability

Port to AMD and Intel

- SLATE and BLAS++ now support all three major GPU platforms

Accomplishment

- Refactored SLATE to use BLAS++ as portability layer
- Ported BLAS++ to AMD rocBLAS and Intel oneMKL

Deliverables Report: <https://www.icl.utk.edu/publications/swan-016>
Code in git repos: bitbucket.org/icl/slate/ and bitbucket.org/icl/blaspp/

Kokkos: Support and AMD Functionality.

ECP WBS [2.3.6.03 – SNL ATDM ST](#)

PI Christian Trott, SNL

Members SNL

Scope and objectives

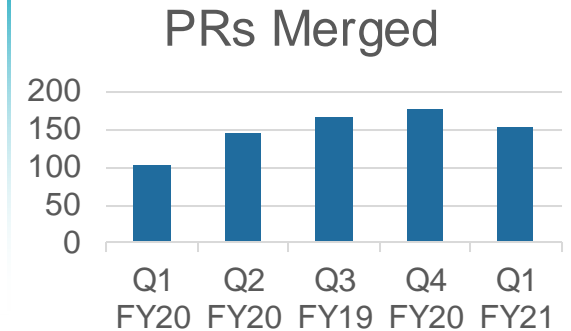

- Kokkos provides the C++ based based Programming Model for Performance Portability for Sandia and many applications at partner institutions
- The goal is to enable single source applications and libraries to simply recompile for new architectures including Exascale Platforms.

AMD Support

- Support for everything KokkosKernels and Trilinos need
- Provided changes for Trilinos to enable Krylov solver
 - Tpetra, Belos fully compile
 - Tpetra >95% of tests pass
- Still running into known AMD bug, reported mid 2020

Support and Development

- Slack continues to be primary support vehicle
- Regular meetings with NNSA customers for progress updates held
- Continue >50 PRs merged per month

Kokkos Update and Maintenance

- Release 3.3 rolled
 - Near Feature Complete Support for HIP
- Added support for Intel OneAPI compiler
- Added support for Fujitsu ARM A64FX and Fujitsu compiler
- Improved Spack support

Deliverables Kokkos: <https://github.com/kokkos/kokkos>
Slack: <https://kokkosteam.slack.com>

FY21: FFT: Application-specific FFT optimizations and integration within Copa and ExaAM

ECP WBS 2.3.3.13 FFT-ECP
PI Jack Dongarra, (UTK – ICL)
Members Stan Tomov (UTK – ICL),
Alan Ayala (UTK – ICL),
Miroslav Stoyanov (ORNL)

Scope and objectives

- Design and implement a sustainable FFT library for Exascale platforms
- Define consistent FFT-ECP APIs for FFTs on Exascale systems to help key ECP applications that need FFT functionalities to run at exascale
- FY21 plan: develop application-specific FFTs, optimizations, and integration in ECP applications; add HIP and DPC++ backends to support AMD and Intel GPUs;
- Milestone driver: Implement multidimensional FFTs and optimizations in heFFTe for applications where the input data is purely real.

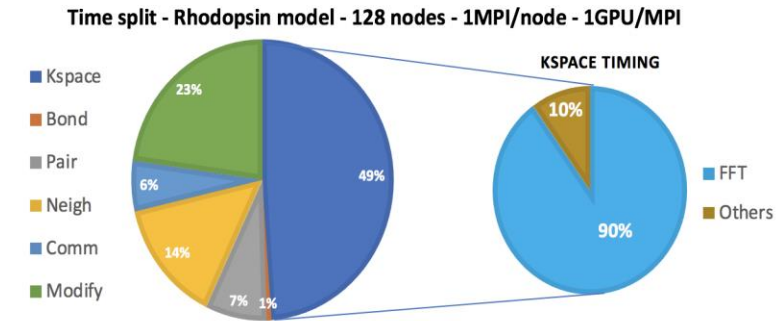

Impact

- Developed application-specific FFT optimizations and integration within Copa and ExaAM applications;
- Provide ECP applications acceleration for their FFT computations on various GPU-accelerated heterogeneous architectures with GPUs from Nvidia, AMD, and Intel;
- FFT-ECP stakeholders are application developers, e.g., LAMMPS and HACC, Copa and ExaAM, as well as ECP vendors where heFFTe enables FFT applications to run more efficiently on current and upcoming platforms.

Deliverables heFFTe 2.1 <http://icl.utk.edu/fft/> multidimensional FFTs and application-specific optimizations with added Intel GPUs support. Relation projects: ECP LAMMPS, HACC, CoPA, Cabana, Alpine, FFTX, SLATE, xSDK, and MAGMA (<http://icl.cs.utk.edu/magma/>) ExaWind, EMPIRE/PIC/PICSAR, WarpX, ExaSky, LatticeQCD/MILC, EXAALT, ExaAM, QMCPACK, NWChemEx

heFFTe 2.1 Release

- Profile on running LAMMPS Rhodopsin benchmark with FFTMPI using 128 Summit nodes on a 1024^3 FFT;
- heFFTe with cuFFT backend accelerates FFT 2X compared to FFTMPI and 25% the entire application

Project accomplishment

- Implemented application-specific FFT optimizations and tuning for systems with Nvidia and AMD GPUs;
- Added Intel GPU support;
- Released heFFTe 2.1 featuring with new application-specific optimizations, tuning, and added Intel GPU support;
- heFFTe Integration and acceleration within CoPA projects and ExaAM/Meumapps.

Document on Performance Evaluation of Solvers in *hypre* 2.20.0

ECP WBS WBS 2.3.3.12
PI Carol Woodward, LLNL
Members LLNL
Milestone Lead Ulrike Meier Yang, LLNL

Scope and objectives

- This project focuses on enhancements for *hypre* and SUNDIALS in preparation for exascale systems
- Goals for *hypre* include increasing GPU-enabled portions as well as portability.
- This milestone evaluates and analyzes the GPU and CPU performance of structured and unstructured solvers in *hypre* for various problems on Lassen and Summit.

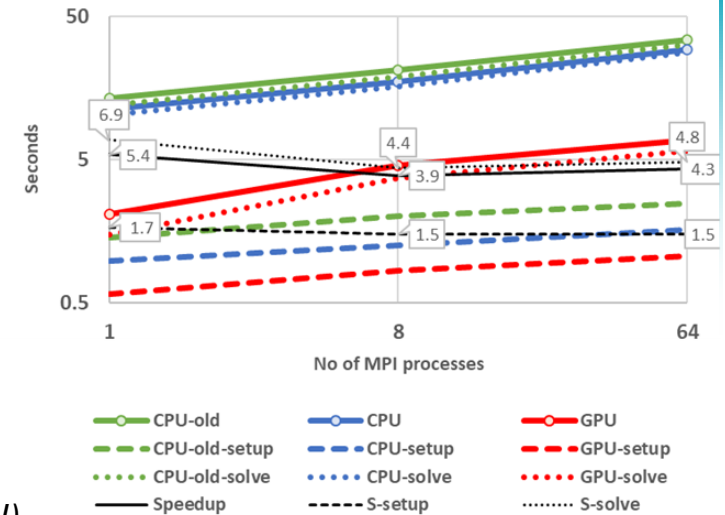

Impact

- Linear systems are an important part of many application codes, and often make up a large portion of their execution times.
- Efficient linear solvers are crucial for ECP applications, and any improvements in performance and memory usage positively impact the applications.

Deliverables The document is available at <https://confluence.exascaleproject.org/display/STLM12/Software+Documents> in file 'Performance Evaluation of *hypre* Solvers.pdf'

Comparing *hypre*'s GPU and CPU performance

Weak scaling study of AMG-PCG applied to an unstructured problem on a crooked pipe on Lassen using 1, 2, or 16 nodes. 'CPU' uses same parameters as 'GPU' including a newly designed interpolation. 'CPU-old' uses the old Interpolation. Presented are setup, solve and total times, including Speedups (CPU/GPU)

Project accomplishment

- Measured GPU and CPU performance of *hypre*'s structured and unstructured solvers on a variety of problems on Lassen and Summit.
- Analyzed and summarized the results in a document that is available on confluence.

Key Product Development Takeaways

ECP ST teams are creating new algorithms that effectively expose and exploit massive on-node parallelism, in addition to MPI

ECP ST products are expanding support to all GPU architectures: Nvidia, AMD, Intel

Application teams are increasingly relying on ECP ST products to get performance & portability

Getting portable performance via E4S products

Challenge: How can I port my code effectively and efficiently to diverse and emerging architectures?

- Goals:
 - Get performance
 - Get all or most of the potential performance on a platform (varies with specific situation)
 - Get on the commodity performance curve: Porting to next similar system, say 2X faster, your code is about 2X faster
 - Get portability
 - Minimize how much special code needs to be written for each target platform
 - Can be done by using portability layers, language features, libraries that provide functionality across many systems
- Examples:
 - Use Kokkos to write your parallel loops:
 - Enables performance across multiple platforms by compiling with a backend that transforms your loops for the target
 - Targets can be Intel CPU, Nvidia GPU, AMD GPU, Intel GPU, Arm SVE, future parallel devices
 - Use PETSc to solve large sparse linear systems:
 - PETSc runs well on CPUs and GPUs, adapting algorithms and implementations behind the scenes
 - Note: Assembling the sparse linear system for GPU systems needs to be done on the GPU, using, e.g., Kokkos

Writing *your* code for portable performance

OpenMP

- An open standard
- Target offload supports GPUs
- Commonly used by Fortran codes, uncommon for C++

Cuda/HIP/SYCL

- Vendor specific, esp CUDA
- HIP portable in principle, but really driven by AMD
- SYCL portable in principle, but really driven by Intel

Kokkos/RAJA

- Kokkos uses C++ template meta-programming, widely used, lots of training and documentation
- RAJA more modular design (e.g., loop vs memory management), fundamental to LLNL ecosystem

Using libraries for portable performance

Dense Lin Alg

- Vendors typically provide, e.g., MKL
- ECP efforts provide alternative for reference and design ideas

FFTs

- Vendors provide building blocks, e.g., 1D
- Many apps have their own 3D framework
- heFFTe provides new portable 3D library emphasizing internode scalability

Sparse Lin Alg

- Strong tradition for DOE
- Sparse direct: SuperLU/STRUMPACK
- Sparse iterative: PETSc, Trilinos/KokkosKernels
- Apps will need to move problem construction to GPU

Addressing IO Bottlenecks

HDF5

- Continued evolution for modern platforms

ADIOS

- Alternative, customizable library
- Also becoming available via HDF5 API

Data compression

- VeloC/SZ
- ZFP
- Libraries that support *in situ* compression

The Growing Complexity of Scientific Application Software Stacks

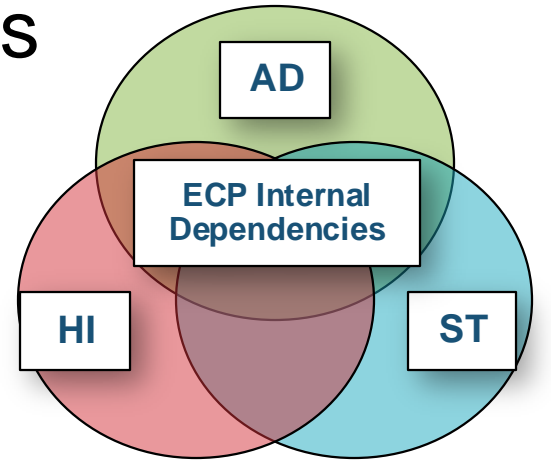

Challenges

- As our software gets more complex, it is getting harder to install tools and libraries correctly in an integrated and interoperable software stack.

ECP apps (AD) are primary consumers of ST products

How community software ecosystems can unlock the potential of exascale computing

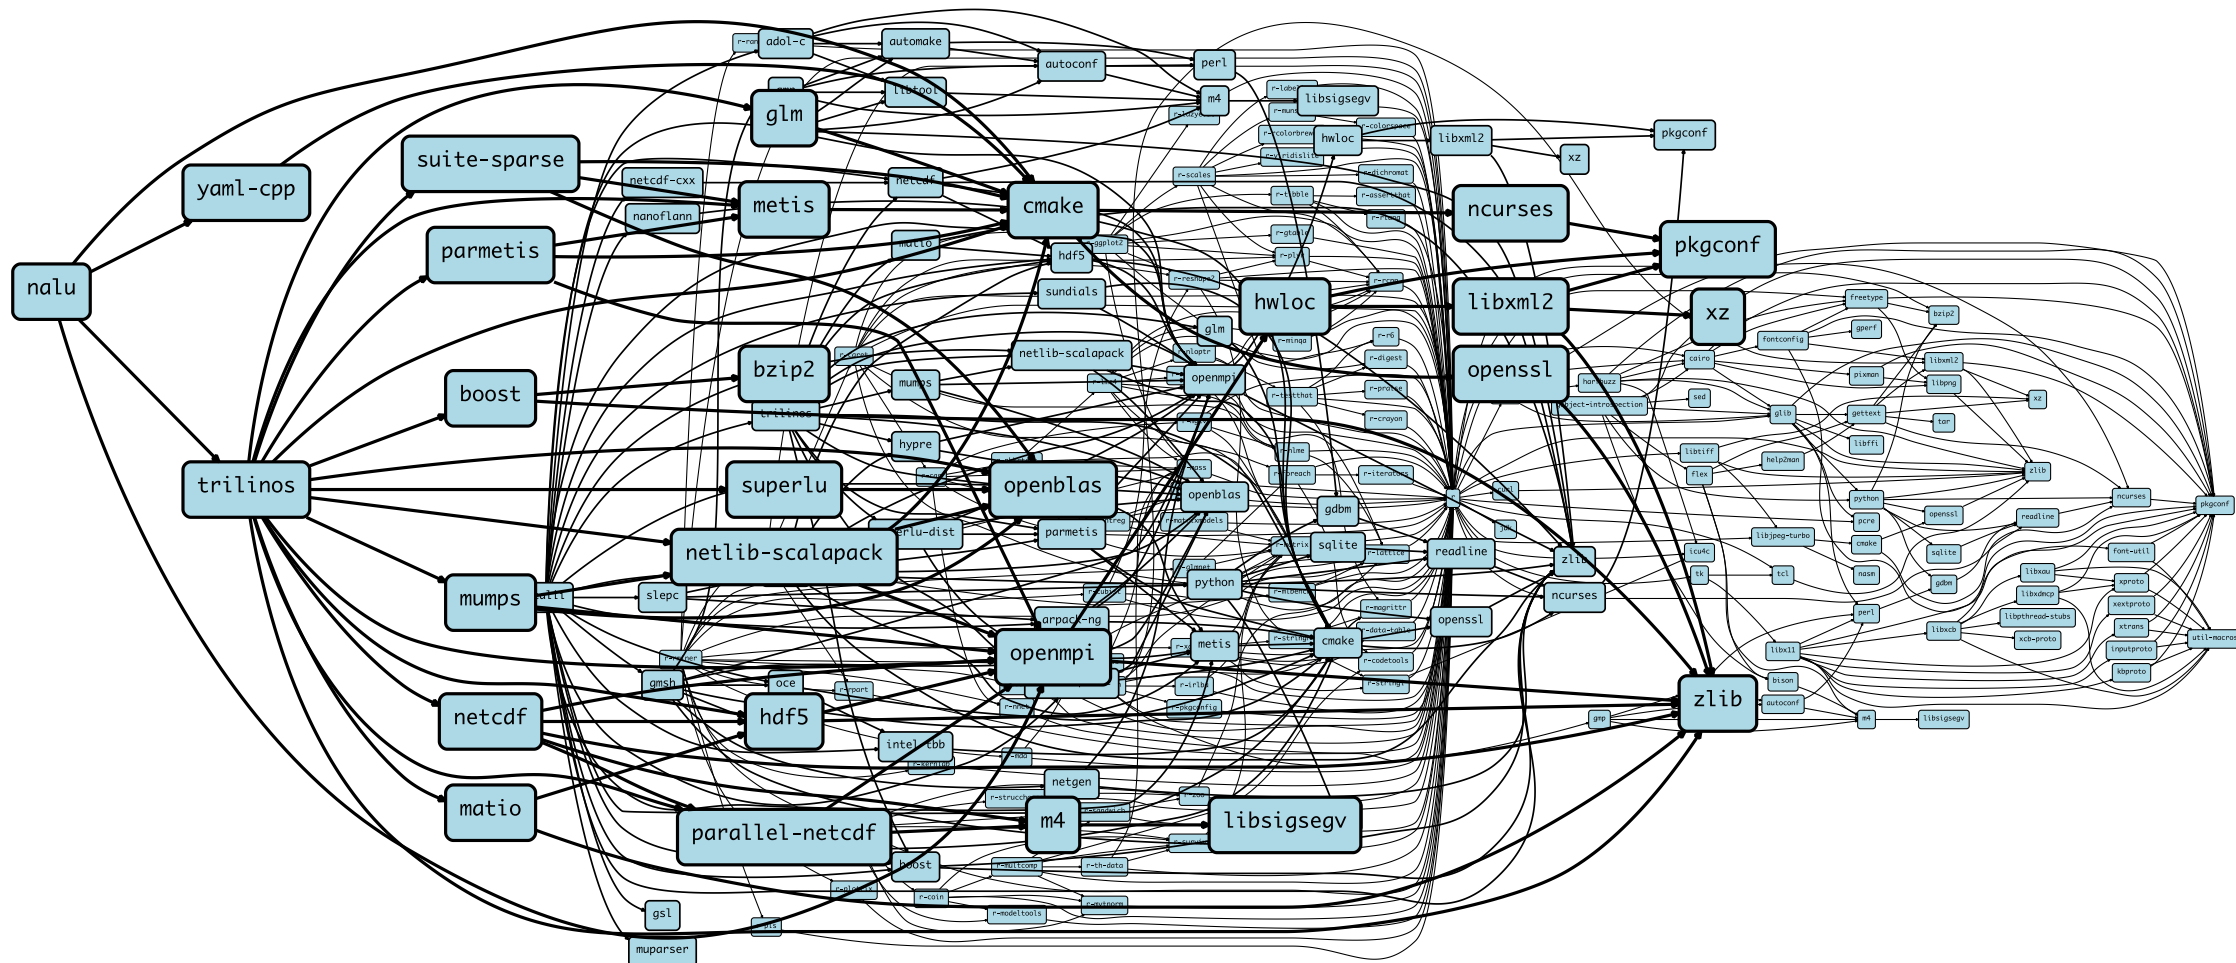

Lois Curfman McInnes, Michael A. Heroux, Erik W. Draeger, Andrew Siegel, Susan Coghlan & Katie Antypas

Nature Computational Science 1, 92-94(2021) | Cite this article
Metrics

Emerging exascale architectures and systems will provide a sizable increase in raw computing power for science. To ensure the full potential of these new and diverse architectures, as well as the longevity and sustainability of science applications, we need to embrace software ecosystems as first-class citizens.

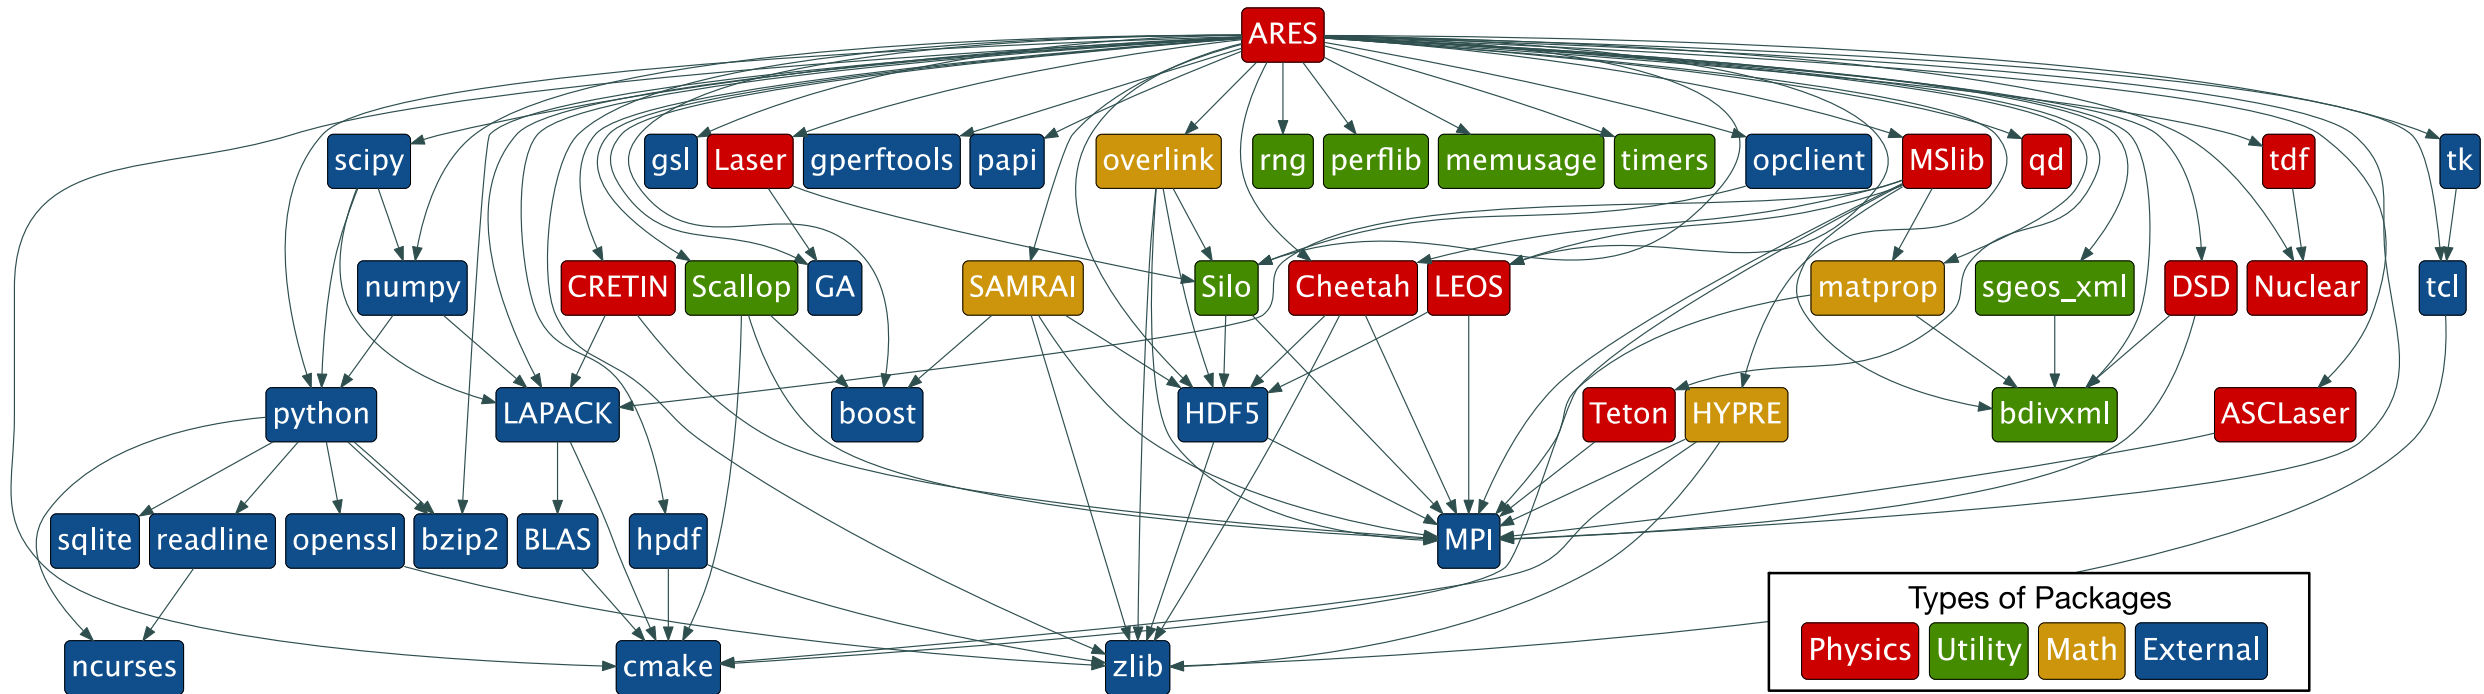

Scientific software is becoming extremely complex

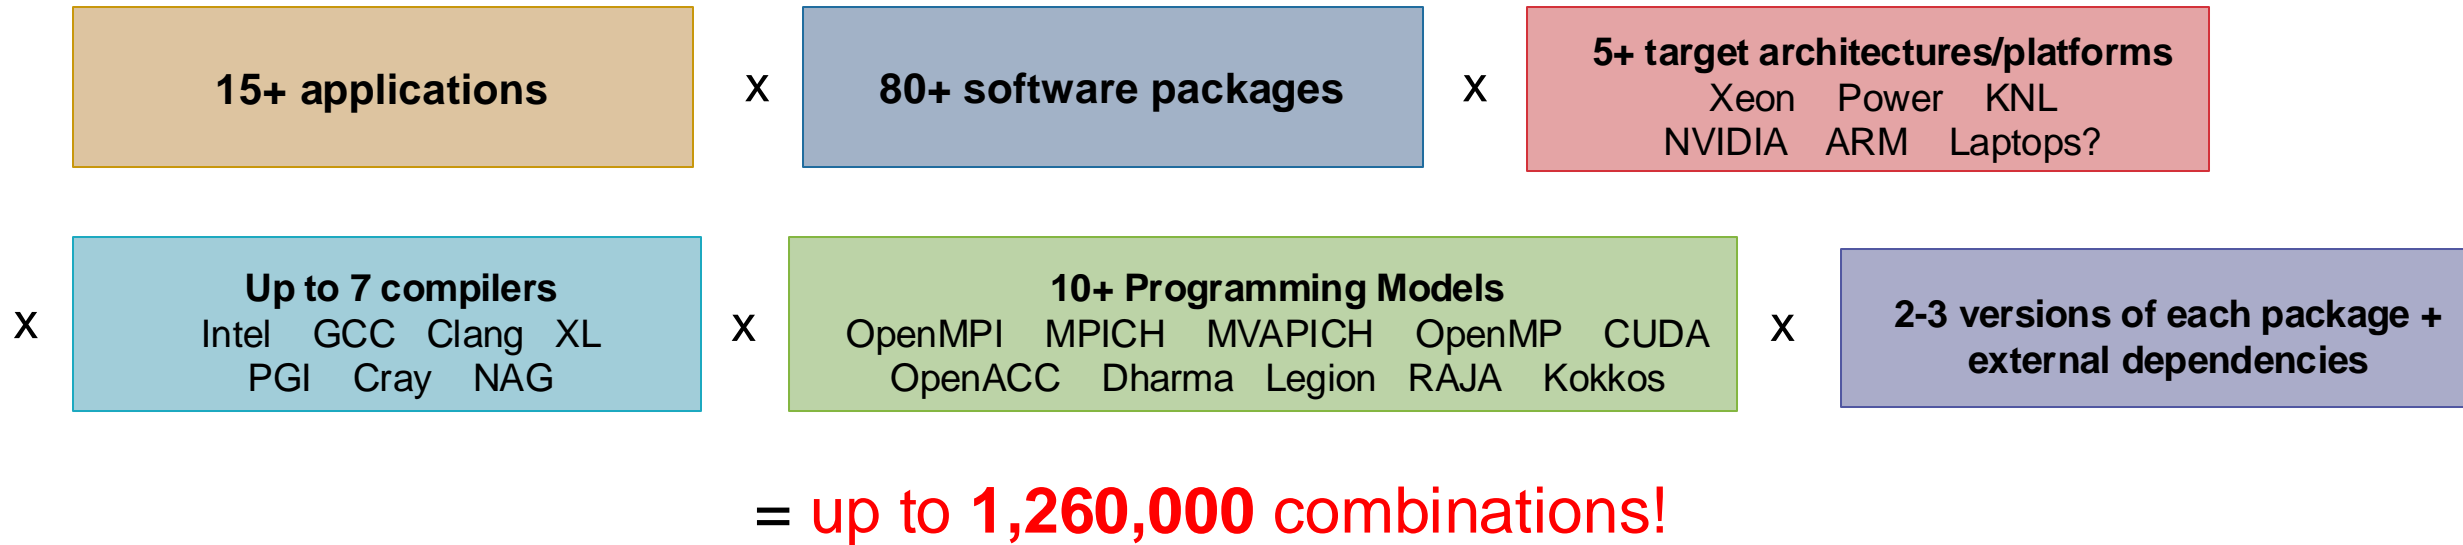

Nalu: Generalized Unstructured Meshes, Hierarchical Parallel Computing, and Adaptive Mesh Refinement

Even proprietary codes are based on many open source libraries

- Half of this DAG is external (blue); *more* than half of it is open source
- Nearly *all* of it needs to be built specially for HPC to get the best performance

The Exascale Computing Project is building an entire *ecosystem*

- Every application has its own stack of dependencies.
- Developers, users, and facilities dedicate (many) FTEs to building & porting.
- Often trade reuse and usability for performance.

We must make it easier to rely on others' software!

How to install software on a supercomputer

1. Download all 16 tarballs you need
2. Start building!

3. Run code
4. **Segfault!?**
5. Start over...

What about modules?

- Most supercomputers deploy some form of *environment modules*
 - TCL modules (dates back to 1995) and Lmod (from TACC) are the most popular

```
$ gcc
- bash: gcc: command not found

$ module load gcc/7.0.1
$ gcc -dumpversion
7.0.1
```

- Modules don't handle installation!
 - They only modify your environment (things like PATH, LD_LIBRARY_PATH, etc.)
- Someone (likely a team of people) has already installed gcc for you!
 - Also, you can *only* `module load` the things they've installed

Spack Overview

Spack

- E4S uses the Spack package manager for software delivery
- Spack provides the ability to specify versions of software packages that are and are not interoperable.
- Spack is a build layer for not only E4S software, but also a large collection of software tools and libraries outside of ECP ST.
- Spack supports achieving and maintaining interoperability between ST software packages.
- <https://spack.io>

Spack is a flexible package manager for HPC

- How to install Spack (works out of the box):

```
$ git clone https://github.com/spack/spack  
$ . spack/share/spack/setup-env.sh
```

- How to install a package:

```
$ spack install tau
```

- TAU and its dependencies are installed within the Spack directory.
- Unlike typical package managers, Spack can also install many variants of the same build.
 - Different compilers
 - Different MPI implementations
 - Different build options

Visit spack.io

 github.com/spack/spack

 [@spackpm](https://twitter.com/spackpm)

Spack provides the *spec* syntax to describe custom configurations

```
$ git clone https://github.com/spack/spack
$ . spack/share/spack/setup-env.sh
$ spack compiler find # set up compilers
$ spack external find # set up external packages
```

```
$ spack install tau unconstrained
$ spack install tau@2.30.1 @ custom version
$ spack install tau@2.30.1 %gcc@7.3.0 % custom compiler
$ spack install tau@2.30.1 %gcc@7.3.0 +level_zero +/- build option
$ spack install tau@2.30.1 %gcc@7.3.0 +mpi ^mvapich2@2.3~wrapperrpath ^ dependency information
```

- Each expression is a **spec** for a particular configuration
 - Each clause adds a constraint to the spec
 - Constraints are optional – specify only what you need.
 - Customize install on the command line!
- Spec syntax is recursive
 - Full control over the combinatorial build space

`spack find` shows what is installed

```

Singularity> spack find

```

- All the versions coexist!
 - Multiple versions of same package are ok.
- Packages are installed to automatically find correct dependencies.
- Binaries work *regardless of user's environment*.
- Spack also generates module files.
 - Don't *have* to use them.

The Spack community is growing rapidly

- **Spack simplifies HPC software for:**
 - Users
 - Developers
 - Cluster installations
 - The largest HPC facilities
- **Spack is central to ECP's software strategy**
 - Enable software reuse for developers and users
 - Allow the facilities to consume the entire ECP stack
- **The roadmap is packed with new features:**
 - Building the ECP software distribution
 - Better workflows for building containers
 - Stacks for facilities
 - Chains for rapid dev workflow
 - Optimized binaries
 - Better dependency resolution

ECP SW Technology Software Architecture – SDKs

ECP applications rely on ST products across all technical areas

24 ECP applications: National security, energy, Earth systems, economic security, materials, data

6 co-design centers: machine learning, graph analytics, mesh refinement, PDE discretization, particles, online data analytics

Consider ECP software technologies needed by 5 ECP applications:

ExaWind: Turbine Wind Plant Efficiency

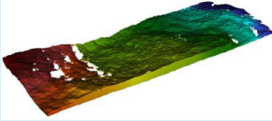

Harden wind plant design and layout against energy loss susceptibility; higher penetration of wind energy

Lead: NREL
DOE EERE

Subsurface: Carbon Capture, Fossil Fuel Extraction, Waste Disposal

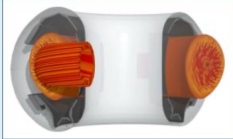

Reliably guide safe long-term consequential decisions about storage, sequestration, and exploration

Lead: LBNL
DOE BES, EERE, FE, NE

WDMApp: High-Fidelity Whole Device Modeling of Magnetically Confined Fusion Plasmas

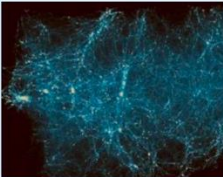

Prepare for ITER experiments and increase ROI of validation data and understanding; prepare for beyond-ITER devices

Lead: PPPL
DOE FES

ExaSky: Cosmological Probe of the Standard Model of Particle Physics

Unravel key unknowns in the dynamics of the Universe: dark energy, dark matter, and inflation

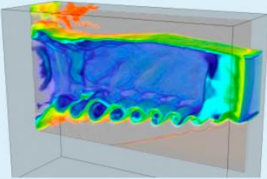

Lead: ANL
DOE HEP

The MARBL Multi-physics Code

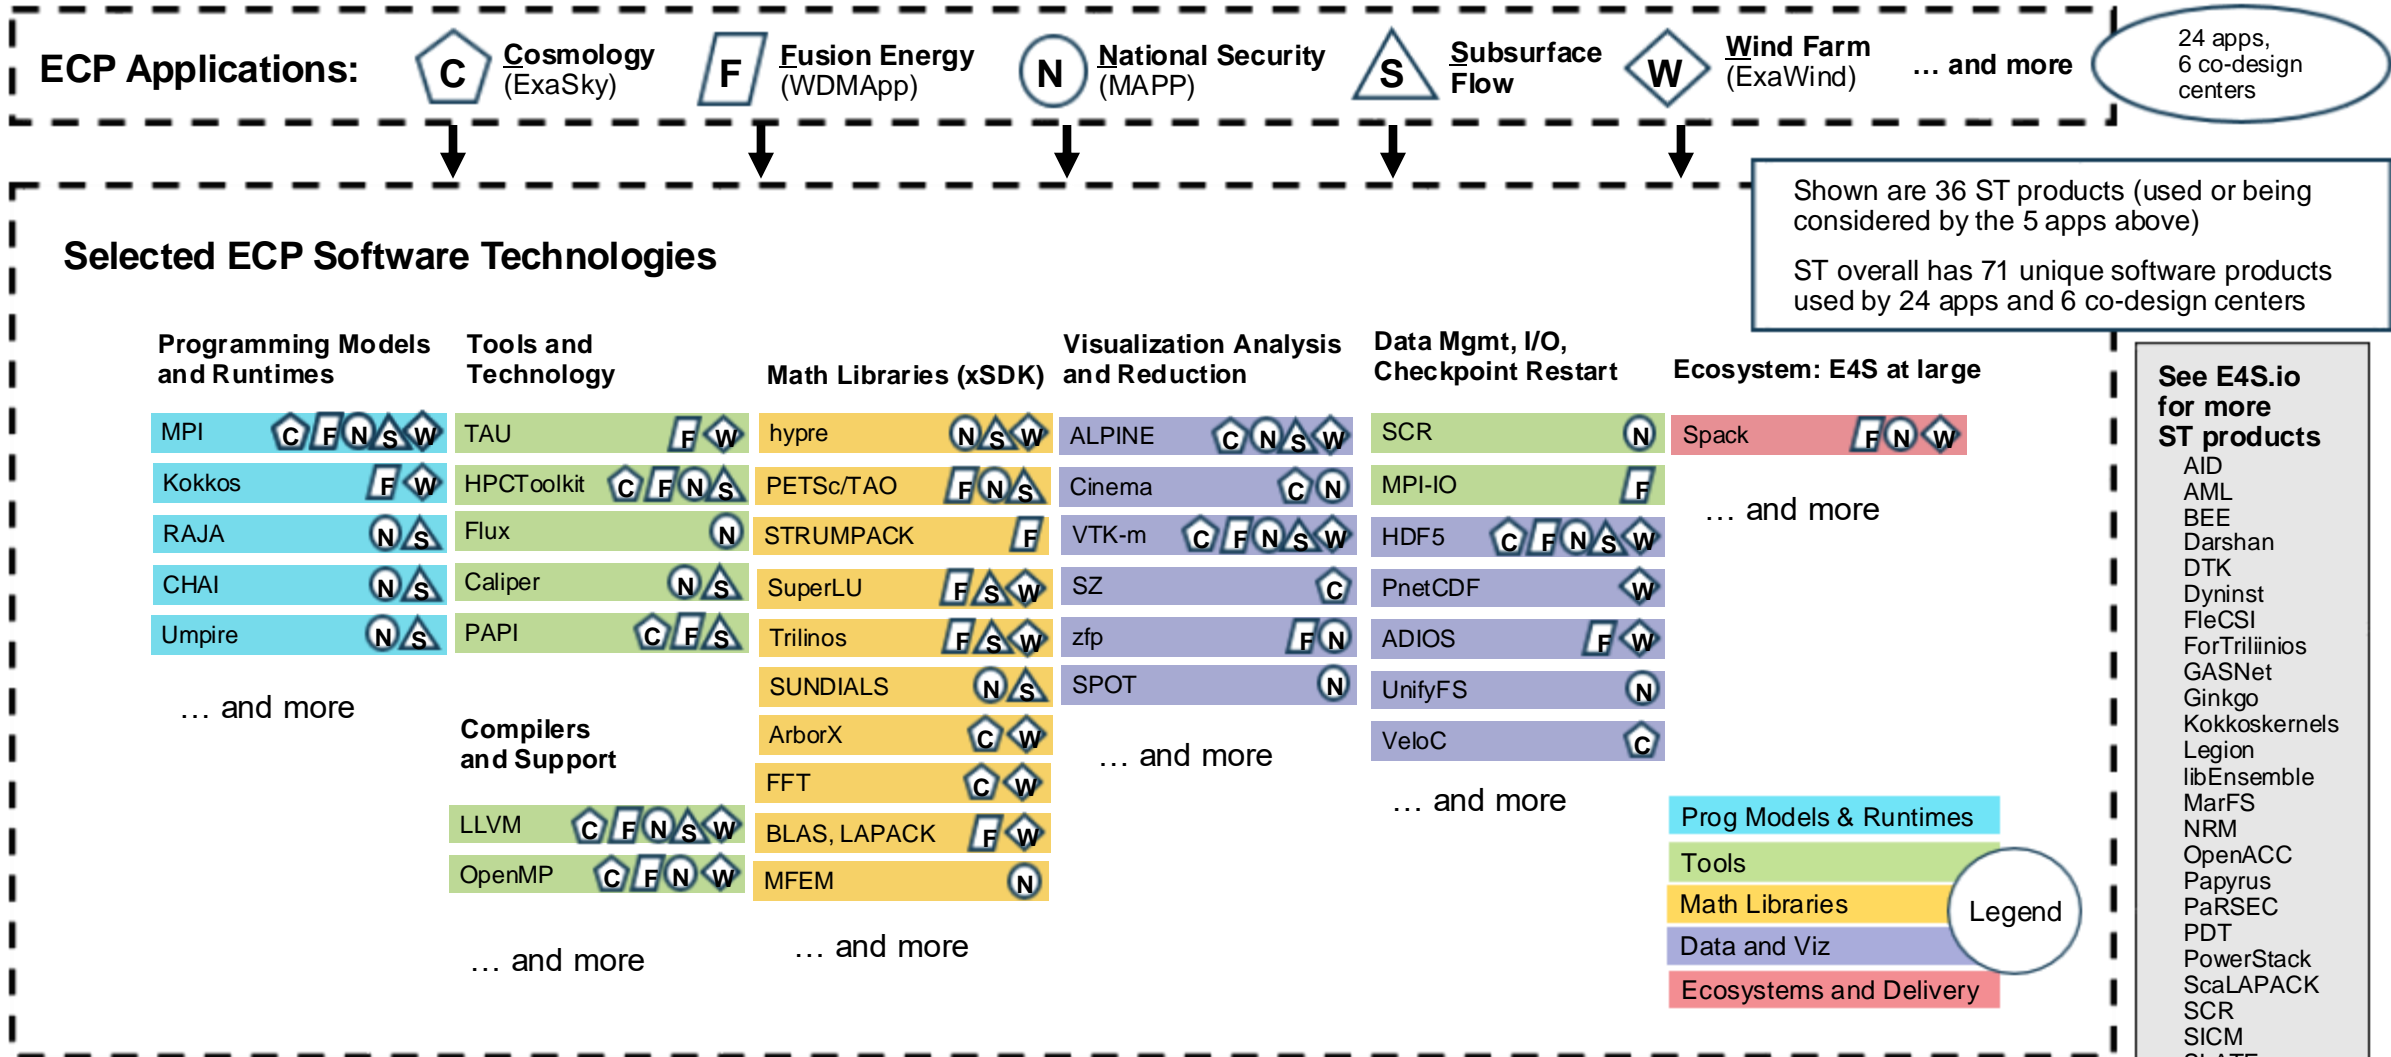

Multi-physics simulations of high energy-density physics and focused experiments driven by high-explosive, magnetic or laser based energy sources

- Magneto-radiation-hydrodynamics at the exascale
- Next-generation pulsed power / ICF modeling
- High-order numerical methods

Lead: LLNL

ECP applications require consistency across the software stack

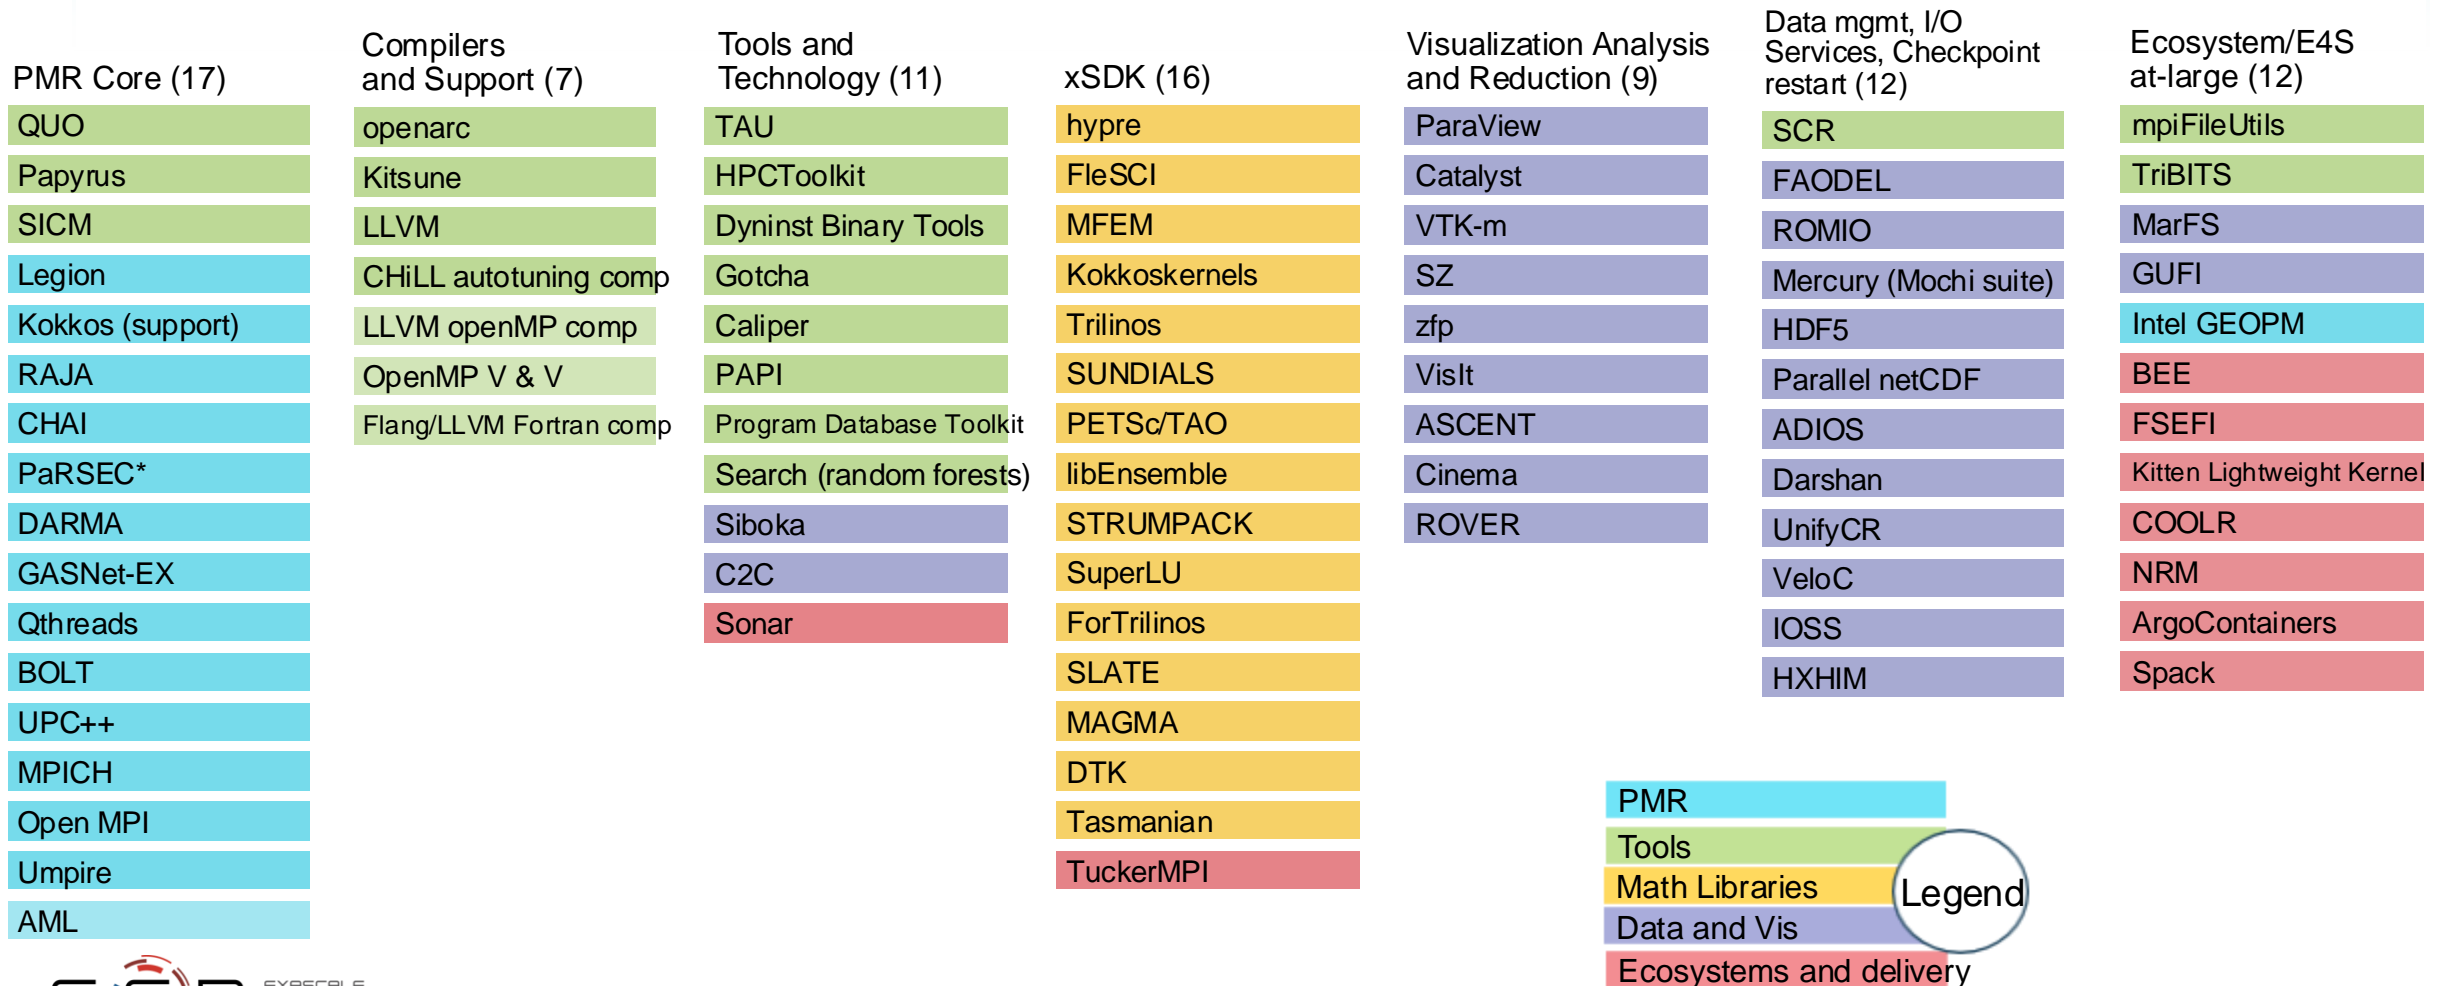

ECP apps rely on multiple software technologies; some software products contribute to multiple distinctly developed components of a multiphysics app (such as fusion energy modeling) that must run within a single executable.

ECP ST SDKs will span all technology areas

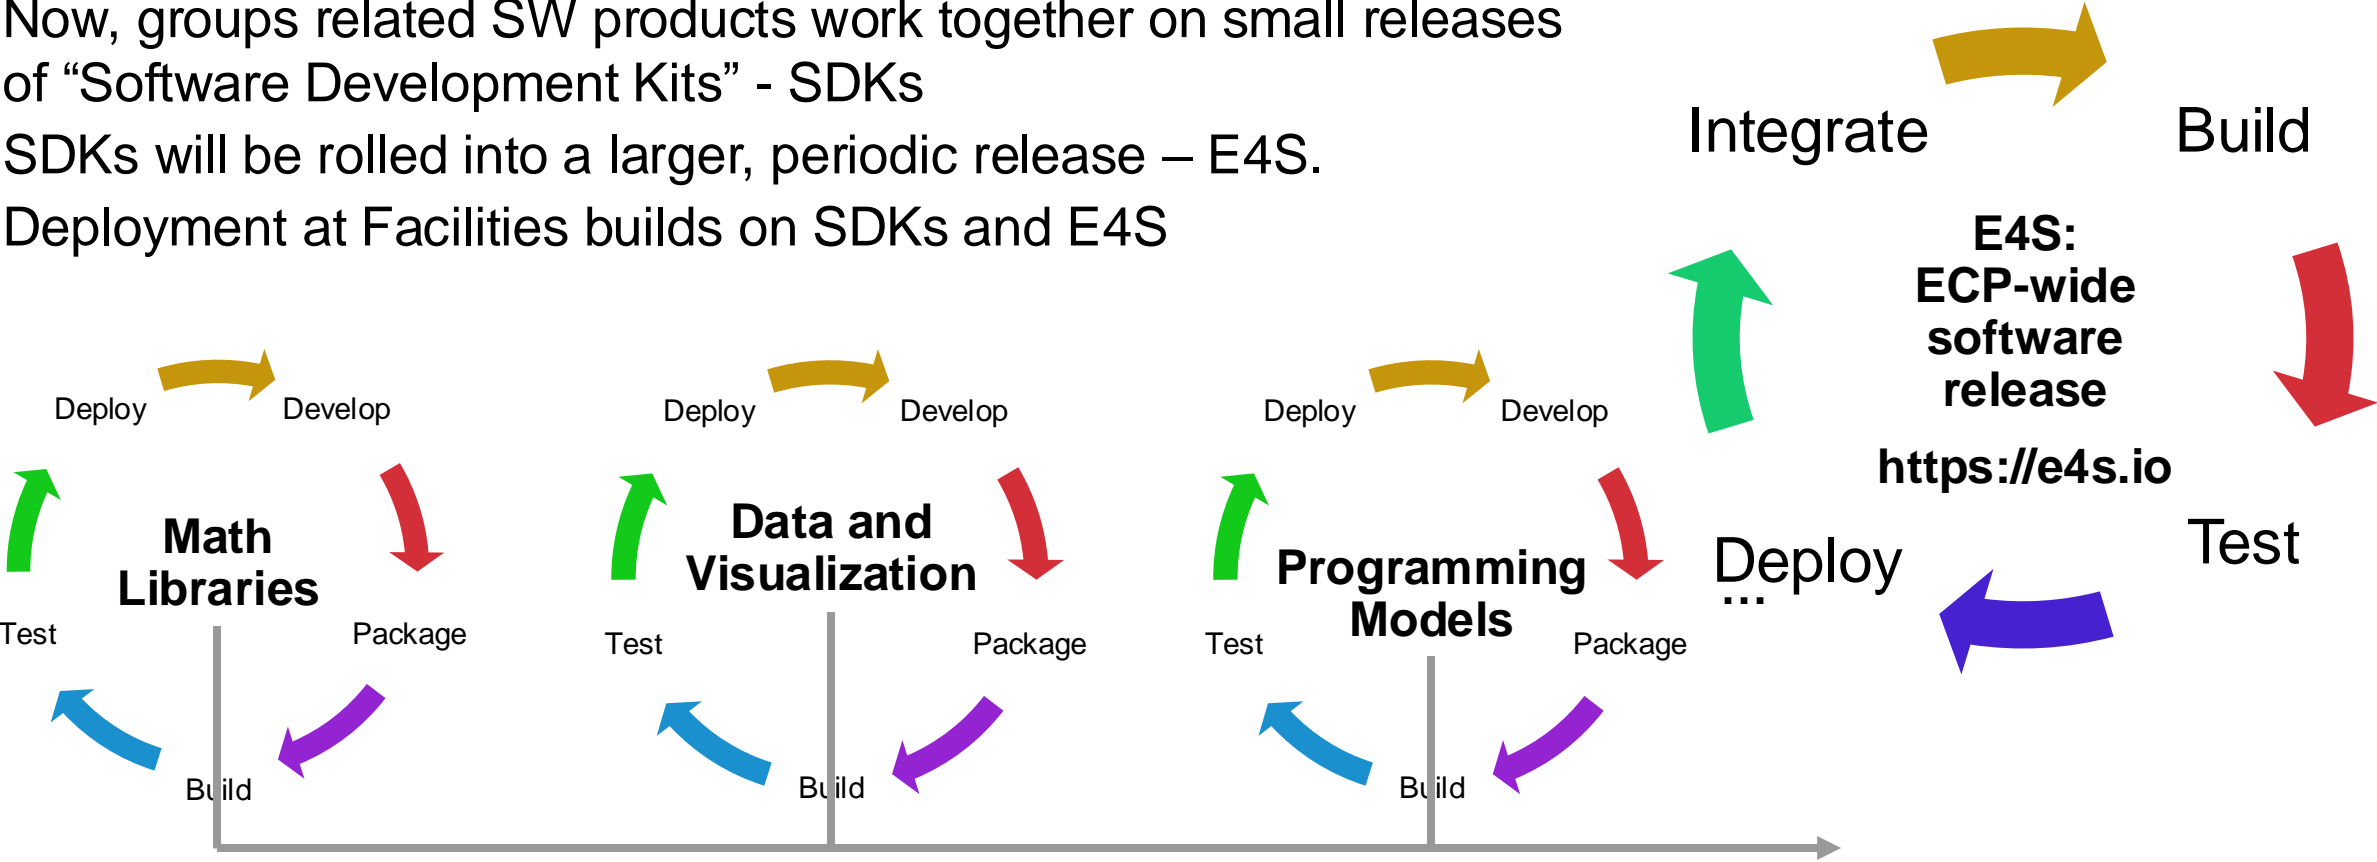

Motivation: Properly chosen cross-team interactions will build relationships that support interoperability, usability, sustainability, quality, and productivity within ECP ST.

Action Plan: Identify product groupings where coordination across development teams will improve usability and practices, and foster community growth among teams that develop similar and complementary capabilities.

ECP is working towards a periodic, hierarchical release process

- In ECP, teams increasingly need to ensure that their libraries and components work together
 - Historically, HPC codes used very few dependencies
- Now, groups related SW products work together on small releases of “Software Development Kits” - SDKs
- SDKs will be rolled into a larger, periodic release – E4S.
- Deployment at Facilities builds on SDKs and E4S

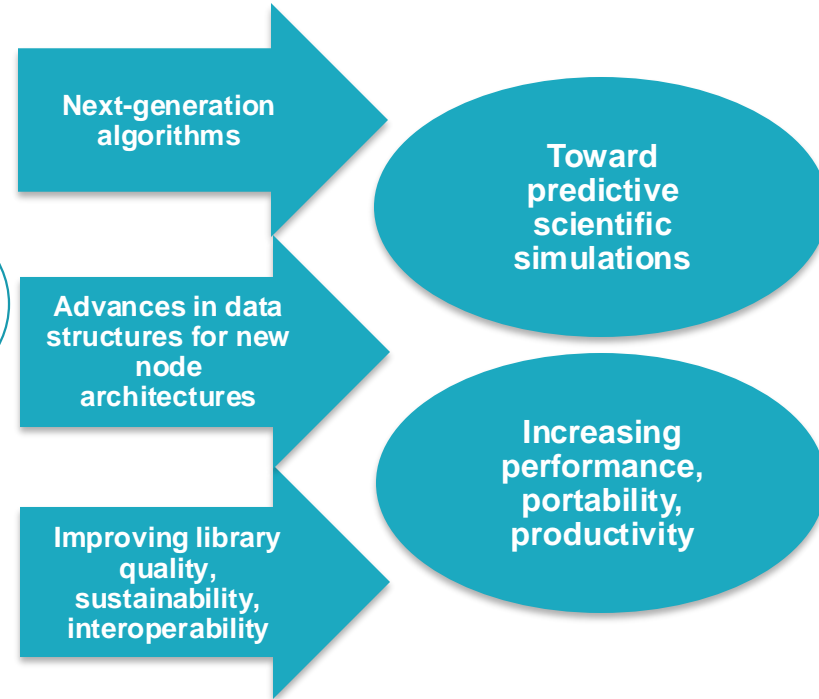

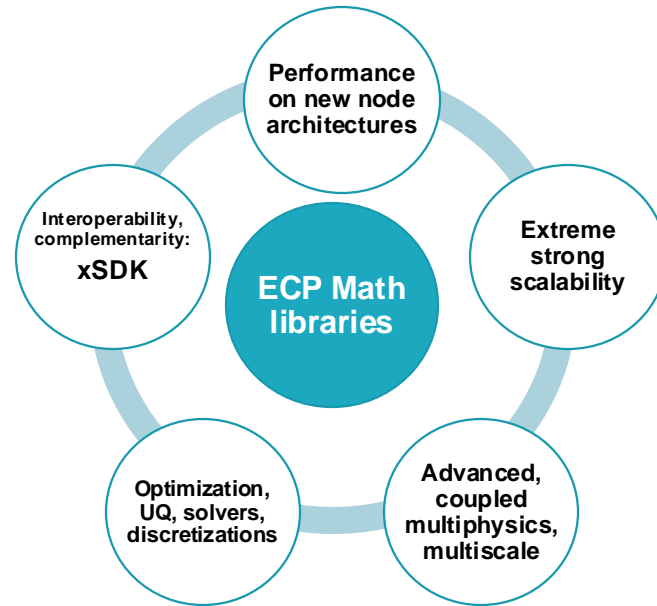

xSDK: Primary delivery mechanism for ECP math libraries' continual advancements toward predictive science

xSDK release 0.6.0 (Nov 2020)

As motivated and validated by the needs of ECP applications:

The Extreme-Scale Scientific Software Stack (E4S)

E4S: Extreme-scale Scientific Software Stack

- Curated, Spack based software distribution
- Spack binary build caches for bare-metal installs
 - x86_64, ppc64le (IBM Power 9), and aarch64 (ARM64)
- Container images on DockerHub and E4S website of pre-built binaries of ECP ST products
- Base images and full featured containers (with GPU support)
- GitHub recipes for creating custom images from base images
- GitLab integration for building E4S images
- E4S validation test suite on GitHub
- E4S-cl container launcher tool for MPI substitution in applications using MPICH ABI
- E4S VirtualBox image with support for container runtimes
 - Docker
 - Singularity
 - Shifter
 - Charliecloud
- AWS and GCP images to deploy E4S

E4S Components

- E4S is a curated release of ECP ST products based on Spack [<http://spack.io>].
- E4S Spack cache to support bare-metal installs at facilities and custom container builds:
 - x86_64, ppc64le, and aarch64
- Container images on DockerHub and E4S website of pre-built binaries of ECP ST products.
- Base images and full featured containers with support for GPUs.
- GitHub recipes for creating custom images from base images.
- e4s-cl for container launch and for replacing MPI in application with system MPI libraries.
- Validation test suite on GitHub provides automated build and run tests.
- Automates build process via GitLab Continuous Integration to ensure packages can be built.
- E4S Doc Portal aggregates and summarizes documentation and metadata by raking product repos.
- E4S VirtualBox image with support for Docker, Shifter, Singularity, and Charliecloud runtimes.
- AWS image to deploy E4S on EC2.
- GCP image to deploy E4S on GCP.

<https://e4s.io>

Core questions E4S is addressing

How can new ECP software capabilities be effectively and efficiently integrated and sustained?

- ECP success requires development, delivery and use of new GPU capabilities in 70 products
- Requires coordination of versioning, integration, testing, debugging, interaction with vendors and facilities
- Requires access to new documentation
- Requires focus on high quality

How can E4S build upon, leverage and extend existing capabilities and activities?

- Using Spack for product installation, leveraging growing Spack capabilities
- Making E4S available via containers, cloud platforms
- Providing integration pathways to multiple destinations: from-source, LLVM, vendor stacks, facilities, etc

How can E4S become a sustainable, open, collaborative software ecosystem for HPC?

- Hierarchical, open architecture to accept and manage community contributions
- Defined processes for community engagement within DOE, with other US agencies, industry, international partners
- Delivering the value proposition of the ecosystem vs each app managing its dependencies

Extreme-scale Scientific Software Stack (E4S)

- E4S: HPC Software Ecosystem – a curated software portfolio
- A **Spack-based** distribution of software tested for interoperability and portability to multiple architectures
- Available from **source, containers, cloud, binary caches**
- Leverages and enhances SDK interoperability thrust
- Not a commercial product – an open resource for all
- Oct 2018: E4S 0.1 - 24 full, 24 partial release products
- Jan 2019: E4S 0.2 - 37 full, 10 partial release products
- Nov 2019: E4S 1.0 - 50 full, 5 partial release products
- Feb 2020: E4S 1.1 - 61 full release products
- Nov 2020: E4S 1.2 (aka, 20.10) - 67 full release products
- Feb 2021: E4S 21.02 - 67 full release, 4 partial release
- May 2021: E4S 21.05 - 76 full release products

E4S Commitment to Quality

- Community Policies
- Practice Improvement

E4S Community Policies V1.0 Released

What is E4S?

The Extreme-scale Scientific Software Stack (E4S) is a community effort to provide open source software packages for developing, deploying and running scientific applications on high-performance computing (HPC) platforms. E4S provides from-source builds and containers of a **broad collection of HPC software packages**.

Purpose

E4S exists to accelerate the development, deployment and use of HPC software, lowering the barriers for HPC users. E4S provides containers and turn-key, from-source builds of more than 80 popular HPC products in programming models, such as MPI; development tools such as HPCToolkit, TAU and PAPI; math libraries such as PETSc and Trilinos; and Data and Viz tools such as HDF5 and Paraview.

Approach

By using Spack as the meta-build tool and providing containers of pre-built binaries for Docker, Singularity, Shifter and CharlieCloud, E4S enables the flexible use and testing of a **large collection of reusable HPC software packages**.

E4S Community Policies Version 1

A Commitment to Quality Improvement

- Will serve as membership criteria for E4S
 - Membership is not required for *inclusion* in E4S
 - Also includes forward-looking draft policies
- Purpose: enhance sustainability and interoperability
- Topics cover building, testing, documentation, accessibility, error handling and more
- Multi-year effort led by SDK team
 - Included representation from across ST
 - Multiple rounds of feedback incorporated from ST leadership and membership
- Modeled after xSDK Community Policies
- <https://e4s-project.github.io/policies.html>

P1 Spack-based Build and Installation Each E4S member package supports a scriptable *Spack* build and production-quality installation in a way that is compatible with other E4S member packages in the same environment. When E4S build, test, or installation issues arise, there is an expectation that teams will collaboratively resolve those issues.

P2 Minimal Validation Testing Each E4S member package has at least one test that is executable through the E4S validation test suite (<https://github.com/E4S-Project/testsuite>). This will be a post-installation test that validates the usability of the package. The E4S validation test suite provides basic confidence that a user can compile, install and run every E4S member package. The E4S team can actively participate in the addition of new packages to the suite upon request.

P3 Sustainability All E4S compatibility changes will be sustainable in that the changes go into the regular development and release versions of the package and should not be in a private release/branch that is provided only for E4S releases.

P4 Documentation Each E4S member package should have sufficient documentation to support installation and use.

P5 Product Metadata Each E4S member package team will provide key product information via metadata that is organized in the *E4S DocPortal* format. Depending on the filenames where the metadata is located, this may require *minimal setup*.

P6 Public Repository Each E4S member package will have a public repository, for example at GitHub or Bitbucket, where the development version of the package is available and pull requests can be submitted.

P7 Imported Software If an E4S member package imports software that is externally developed and maintained, then it must allow installing, building, and linking against a functionally equivalent outside copy of that software. Acceptable ways to accomplish this include (1) forsaking the internal copied version and using an externally-provided implementation or (2) changing the file names and namespaces of all global symbols to allow the internal copy and the external copy to coexist in the same downstream libraries and programs. This pertains primarily to third party support libraries and does not apply to key components of the package that may be independent packages but are also integral components to the package itself.

P8 Error Handling Each E4S member package will adopt and document a consistent system for signifying error conditions as appropriate for the language and application. For e.g., returning an error condition or throwing an exception. In the case of a command line tool, it should return a sensible exit status on success/failure, so the package can be safely run from within a script.

P9 Test Suite Each E4S member package will provide a test suite that does not require special system privileges or the purchase of commercial software. This test suite should grow in its comprehensiveness over time. That is, new and modified features should be included in the suite.

IDEAS-ECP team works with the ECP community to improve developer productivity and software sustainability as key aspects of increasing overall scientific productivity.

- 1 Customize and curate methodologies**
 - Target scientific software productivity and sustainability
 - Use workflow for best practices content development

- 2 Incrementally and iteratively improve software practices**
 - Determine high-priority topics for improvement and track progress
 - *Productivity and Sustainability Improvement Planning (PSIP)*

- 3 Establish software communities**
 - Determine community policies to improve software quality and compatibility
 - Create Software Development Kits (SDKs) to facilitate the combined use of complementary libraries and tools

- 4 Engage in community outreach**
 - Broad community partnerships
 - Collaboration with computing facilities
 - Webinars, tutorials, events
 - *WhatIs* and *HowTo* docs
 - Better Scientific Software site (<https://bssw.io>)

Productivity and Sustainability Improvement Planning (PSIP)

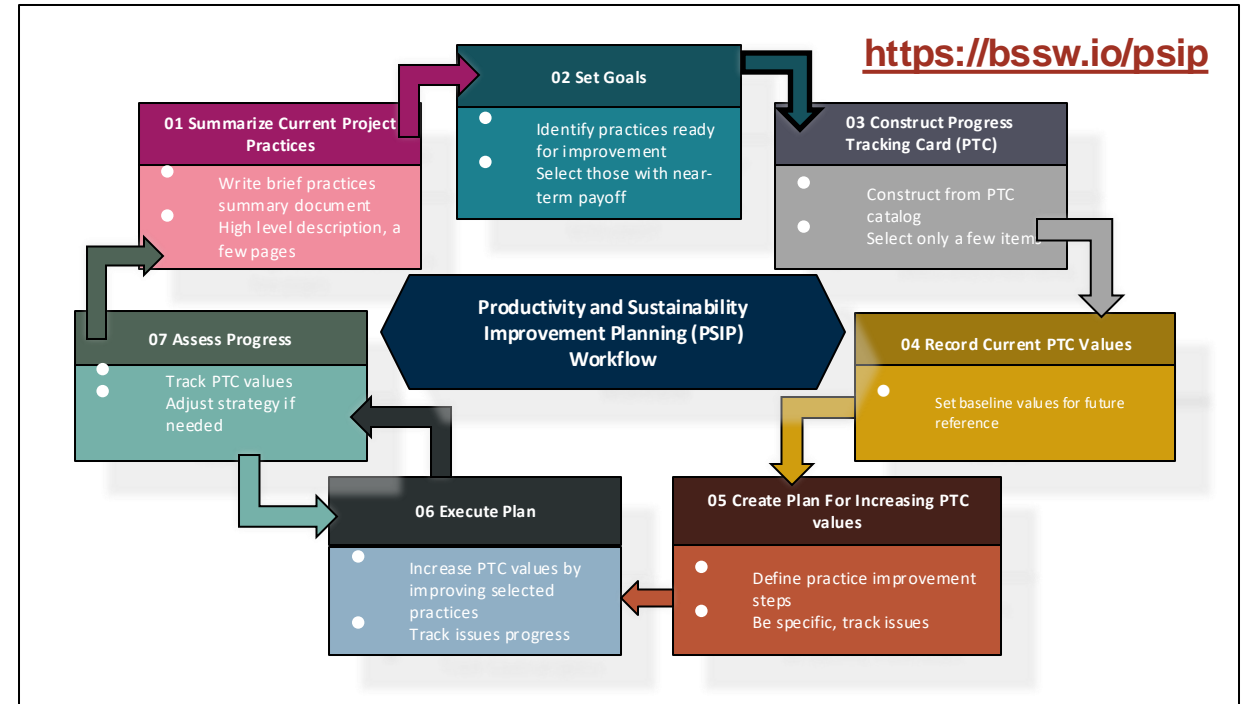

A lightweight iterative workflow, where teams identify their most urgent software bottlenecks and track progress to overcome them.

Snapshot of PSIP Progress Tracking Card (PTC)

Developers of HDF5 used PSIP to:

- Modernize processes for handling documentation (PTC)
- Move HDF5 from a THG managed Bitbucket instance to GitHub (PTC)
- Define and adopt a set of consistent coding standards (PTC)

Score	Description
0	Multiple RM versions based on different technologies exist. Stakeholders and requirements are not documented and partially unknown.
1	Stakeholder requirements are identified and documented. The requirements list is prioritized.
2	Potential technical solutions have been researched and the pros & cons of each have been evaluated.
3	A technical solution has been selected and an outline of the end product vetted by stakeholders.
4	Existing artifacts have been converted to the new system.
5	The process for updating the API and the accompanying RM entries is documented and followed.
6	An RM maintenance plan is created.
7	The process for reviewing and improving RM entries is documented and incorporated into the product life cycle.

“The PSIP project had an immediate impact on our community. With the GitHub move we see increasing amount of small but very valuable contributions to make HDF5 code and documentation better.” Elena Pourmal, Director of Engineering, The HDF Group

Better Scientific Software (BSSw) Fellowship Program

Meet Our Fellows

The BSSw Fellowship program gives recognition and funding to leaders and advocates of high-quality scientific software. Meet the Fellows and Honorable Mentions and learn more about how they impact Better Scientific Software.

Goal: Foster and promote practices, processes, and tools to improve developer productivity and software sustainability of scientific codes.

2018 - 2020

Coming soon: announcement of 2021 Fellows and HMs

2018 Class

Fellows

Jeffrey Carver

University of Alabama

Improving code quality through modern peer code review

Ivo Jimenez

University of California, Santa Cruz

Enabling reproducible research through automated computational experimentation

Daniel S. Katz

University of Illinois at Urbana-Champaign, National Center for Supercomputing Applications

Giving software developers long-overdue credit through principles for software citation

Andrew Lumsdaine

Pacific Northwest National Laboratory, University of Washington, Northwest Institute for Advanced Computing

Guiding efficient use of modern C++ for high-performance computing

Honorable Mentions

Neal Davis

University of Illinois at Urbana-Champaign

Teaching Assistant Professor, Computer Science

Marc Henry de Frahan

National Renewable Energy Laboratory

Postdoctoral Researcher

Elsa Gonsiorowski

Lawrence Livermore National Laboratory

HPC I/O Specialist, Livermore Computing

Ying Li

Argonne National Laboratory

Argonne Scholar, Argonne Leadership Computing Facility

2019 Class

Fellows

Rene Gassmoeller

University of California, Davis

Guiding your scientific software project from inception to long-term sustainability

Ignacio Laguna

Lawrence Livermore National Laboratory

Improving the reliability of scientific applications by analyzing and debugging floating-point software

Tanu Malik

DePaul University

Reducing technical debt in scientific software through reproducible containers

Kyle Niemeyer

Oregon State University

Educating scientists on best practices for developing research software

Honorable Mentions

Stephen Andrews

Los Alamos National Laboratory

Staff Scientist, XCP-B Verification and Analysis

Nasir Eisty

University of Alabama

Ph.D. Student, Computer Science

Benjamin Pritchard

Virginia Tech

Software Scientist, Molecular Sciences Software Institute

Vanessa Sochat

Stanford University

Research Software Engineer, Stanford Research Computing Center

2020 Class

Fellows

Nasir Eisty

University of Alabama

Automating testing in scientific software

Damian Rouson

Sustainable Horizons Institute, Sorcery Institute

Introducing agile scientific software development to underrepresented groups

Cindy Rubio-Gonzalez

University of California, Davis

Improving the reliability and performance of numerical software

Honorable Mentions

David Boehme

Lawrence Livermore National Laboratory

Research Staff, Center for Applied Scientific Computing

Sumana Harihareswara

Changest Consulting

Founder and Principal, Open source software management and collaboration

David Rogers

National Center for Computational Sciences, Oak Ridge National Lab

Computational Scientist

Advancing Scientific Productivity through Better Scientific Software: Developer Productivity & Software Sustainability Report

Disruptive changes in computer architectures and the complexities of tackling new frontiers in extreme-scale modeling, simulation, and analysis present daunting challenges to software productivity and sustainability.

This report explains the IDEAS approach, outcomes, and impact of work (in partnership with the ECP and broader computational science community).

Target readers are all those who care about the quality and integrity of scientific discoveries based on simulation and analysis. While the difficulties of extreme-scale computing intensify software challenges, issues are relevant across all computing scales, given universal increases in complexity and the need to ensure the trustworthiness of computational results.

Preparing public report update to be released in Jan 2021: adding topics that are completely new this year (Performance Portability Panel Series, Strategies for Working Remotely Panel Series), topics not previously discussed in depth (Collegeville Workshop Series on Scientific Software, tools for analysis), as well as an update on Productivity and Sustainability Improvement Planning. Info provided in internal ECP report, Sept 2020.

Using E4S: From source using Spack and build caches

E4S Spack environment spack.yaml

The screenshot shows the GitHub interface for the repository 'UO-OACISS / e4s'. The file 'spack.yaml' is selected, showing a commit by 'eugenewalker' from March 23, 2020. The file content is as follows:

```
1 spack:
2   concretization: separately
3   definitions:
4     - e4s:
5       - openpmc-api
6       - slate
7       - magma
8       - stc
9       - py-Libensemble^python@3.7.3
10      - flecsi+cinch
11      - hypre
12      - mfem
13      - trilinos@12.14.1+dtk+intrepid2+shards
14      - sundials
15      - petsc
16      - strumpack
17      - superlu-dist
18      - superlu
19      - tasmanian
20      - openblas threads=openmp
21      - faodel
22      - mercury
23      - hdf5
24      - adios2
25      - adios
26      - darshan-runtime
27      - darshan-util
28      - veloc
29      - scr
```

- Bare-metal install
% cat spack.yaml
% spack -e . install
- Docker build:

Executable File | 2 lines (2 sloc) | 78 Bytes

```
1 #!/bin/bash -x
2 docker build --no-cache -t ecpe4s/ubuntu18.04-e4s-x86_64:1.2 .
```

E4S: Spack Build Cache at U. Oregon

E4S Build Cache for Spack 0.16.2

To use this build cache, just add it to your Spack

```
spack mirror add E4S https://cache.e4s.io
spack buildcache keys -it
```

WDMApp: Speeding up bare-metal installs using E4S build cache

The screenshot shows a web browser displaying the WDMApp documentation page for Rhea machines. The page features the ECP logo and the title 'WDMApp Whole Device Model application'. A 'Note' section highlights that the E4S project has created a build cache for Rhea, which provides precompiled binaries to reduce installation time. Below the note, terminal instructions are provided for setting up the Spack build cache. The page also includes a 'CONTENTS' sidebar with links to various sections, including 'Building WDMApp' and 'Using E4S WDMApp docker container'.

Note

The [E4S project](#) has created a build cache for Rhea. This provides many packages as precompiled binaries, so will reduce the installation time. To use it:

```
$ wget https://oaciss.uoregon.edu/e4s/e4s.pub
$ spack gpg trust e4s.pub
$ spack mirror add E4S https://cache.e4s.io/e4s
```

Building WDMApp

You should be able to just follow the generic instructions from [Building WDMAPP](#).

Using E4S WDMApp docker container

Alternatively, the [E4S project](#) has created a docker image that mirrors the Rhea environment, which can be used for local development and debugging. To run this image, you need to have docker installed and then do the following:

E4S Spack build cache:

- WDMApp added E4S mirror
 - Speedup: 10X
- Pantheon: 10X
 - Another 10X via “smoother” installs
- Latest: ExaWind (Nalu-Wind)
 - 6 minutes with build cache
 - Up to 4 hours without

- <https://wdmapp.readthedocs.io/en/latest/machines/rhea.html>

Using E4S with containers

What are containers

A lightweight collection of executable software that encapsulates everything needed to run a single specific task

- Minus the OS kernel

- Based on Linux only

Processes and all user-level software is isolated

Creates a portable* software ecosystem

Think `chroot` on steroids

Docker most common tool today

- Available on all major platforms

- Widely used in industry

- Integrated container registry via Dockerhub

Hypervisors and Containers

Type 1 hypervisors insert layer below host OS

Type 2 hypervisors work as or within the host OS

Containers do not abstract hardware, instead provide “enhanced chroot” to create isolated environment

Location of abstraction can have impact on performance

All enable custom software stacks on existing hardware

Type 1 Hypervisor

Type 2 Hypervisor

Containers

E4S Support for Singularity Container Runtime [Sylabs.io]

The screenshot shows a web browser window with the URL <https://e4s-project.github.io/download.html>. The page content includes:

- Docker images are available on the [E4S Docker Hub](#) and in compressed XZ format on [E4S servers](#).
- Recipes for building images from scratch are available on the [E4S GitHub repository](#).
- Our recipes make use of Spack packages available as pre-built binaries in the [E4S build cache](#).

The page is divided into two main sections:

- Container Releases** (indicated by a download icon):
 - Docker Download
 - Singularity x86_64 Download** (highlighted with a blue box)
 - Singularity ppc64le Download
 - CharlieCloud Download
 - OVA Download
- From source with Spack** (indicated by a code icon):
 - Visit the Spack Project
 - Text: Spack contains packages for all of the products listed in the E4S 1.0 Full Release category (see above 1.0 Release Notes). General instructions for building software with Spack can be found at the Spack website. For more information, see `/usr/local/packages/ecp` in the...

- `wget http://tau.uoregon.edu/ecp.simg`; `singularity run ./ecp.simg`
- `singularity run ecp.simg`
- **Supports Intel OneAPI, CUDA, and ROCm**
- `spack find`

E4S v2021-02 Release: GPU, ppc64le for Docker Containers

The screenshot shows the Docker Hub interface for the repository `ecpe4s/ubuntu18.04-e4s-gpu-ppc64le`. The repository is described as "E4S: Extreme-scale Scientific Software Stack" and is public. It was last pushed 2 minutes ago. The page includes sections for "Tags and Scans" (with 7 tags), "Recent builds", and "Docker commands" (showing `docker push ecpe4s/ubuntu18.04-e4s-gpu-ppc64le:tagname`). A "Public View" button is also visible.

TAG	OS	PUSHED
latest	ppc64le	2 minutes ago
2020-11-04	ppc64le	a day ago
2020-11-01	ppc64le	4 days ago
2020-10-27	ppc64le	9 days ago

- 67 ECP Products
- Support for GPUs
 - NVIDIA (CUDA 10.2)
 - ppc64le and x86_64

```
% docker pull ecpe4s/ubuntu18.04-e4s-gpu
```

E4S: ppc64le Base Container Images

The screenshot shows the Docker Hub interface. At the top, there's a navigation bar with 'docker hub' logo, a search bar containing 'ppc64le', and links for 'Explore', 'Repositories', 'Organizations', 'Get Help', and a user profile for 'exascaleproject'. Below the navigation, there's a search filter for 'ecpe4s' and a search bar with 'ppc64le'. A 'Create Repository +' button is visible. The main content area displays three search results:

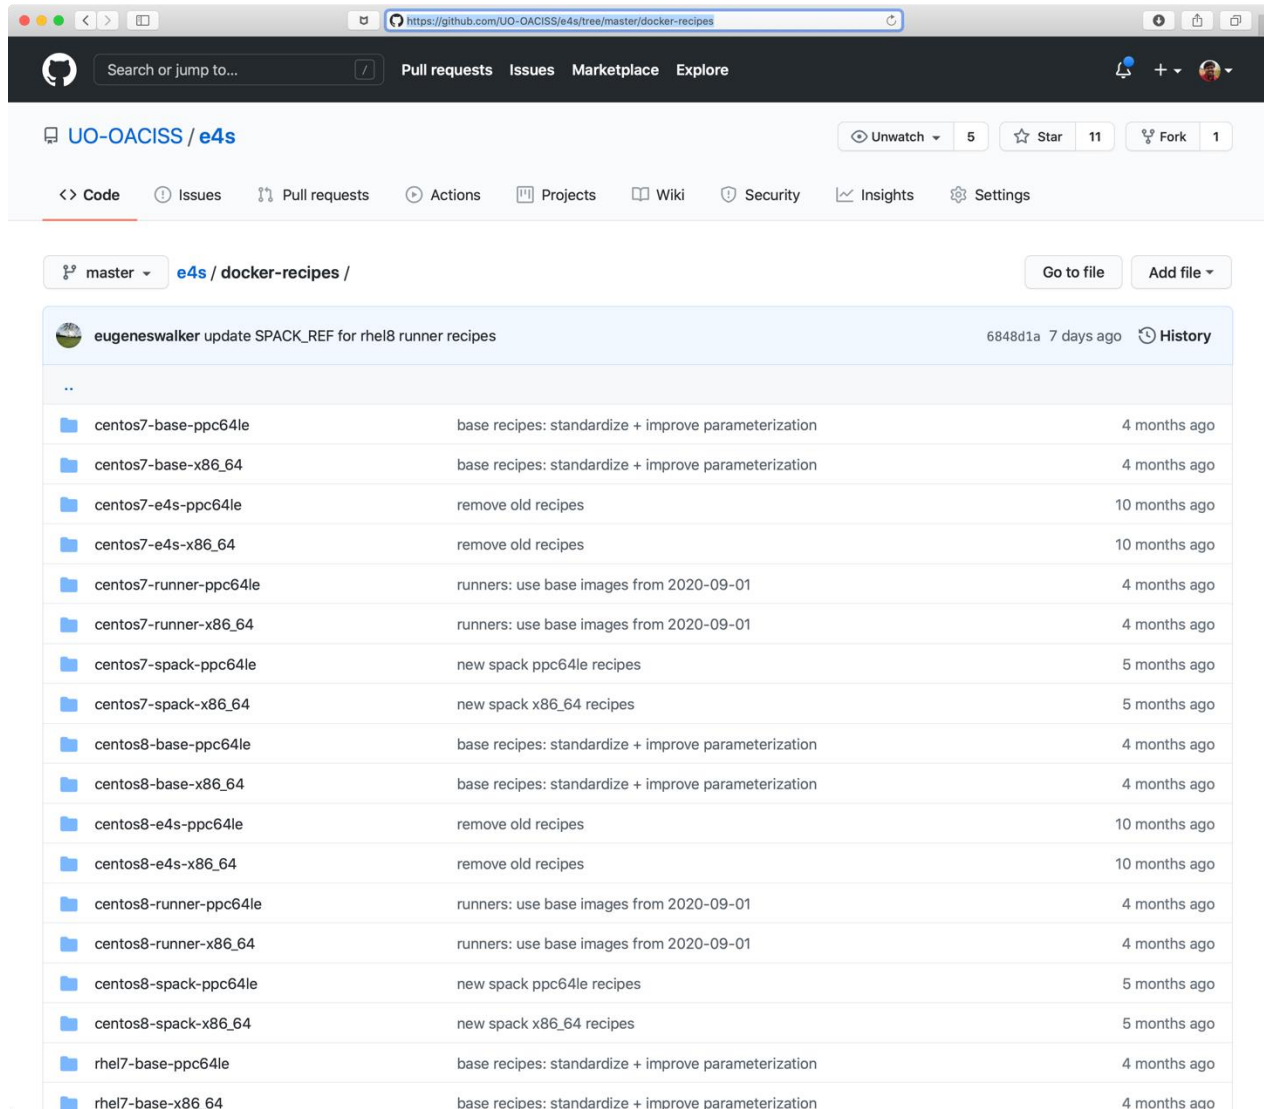

Repository Name	Stars	Downloads	Visibility
ecpe4s / ubuntu1804_ppc64le_base Updated 2 days ago	0	7	PUBLIC
ecpe4s / ubi7_ppc64le_base Updated 2 days ago	0	7	PUBLIC
ecpe4s / centos7_ppc64le_base Updated 2 days ago	0	10	PUBLIC

Below the results, there's a tip: "Tip: Not finding your repository? Try switching namespace via the top left dropdown." On the right side, there's an 'Organizations' section listing 'ecpcontainers', 'ecpe4s', and 'ecpsdk'. At the bottom right, there are two promotional banners: 'Download Docker Desktop' and 'Secure, Private Repo Pricing'.

- Centos 7.6

Multi-platform E4S Docker Recipes

The screenshot shows a GitHub repository page for 'UO-OACISS / e4s'. The repository is on the 'master' branch and contains a directory named 'docker-recipes'. The file tree lists various recipe folders, each with a description and a commit date. The folders are organized by platform (centos7, centos8, rhel7) and architecture (ppc64le, x86_64). The descriptions indicate the purpose of each folder, such as 'base recipes: standardize + improve parameterization' or 'runners: use base images from 2020-09-01'.

Folder Name	Description	Commit Date
centos7-base-ppc64le	base recipes: standardize + improve parameterization	4 months ago
centos7-base-x86_64	base recipes: standardize + improve parameterization	4 months ago
centos7-e4s-ppc64le	remove old recipes	10 months ago
centos7-e4s-x86_64	remove old recipes	10 months ago
centos7-runner-ppc64le	runners: use base images from 2020-09-01	4 months ago

e4s-cl: A tool to simplify the launch of MPI jobs in E4S containers

- E4S containers support replacement of MPI libraries using MPICH ABI compatibility layer.
- Applications binaries built using E4S can be launched with Singularity using MPI library substitution for efficient inter-node communications.
- e4s-cl is a new tool that simplifies the launch and MPI replacement.
- Usage:
 1. `e4s-cl init ...`
 2. `e4s-cl mpirun -np <> -hosts <> <command>`

<https://github.com/E4S-Project/e4s-cl>

e4s-cl Container Launcher

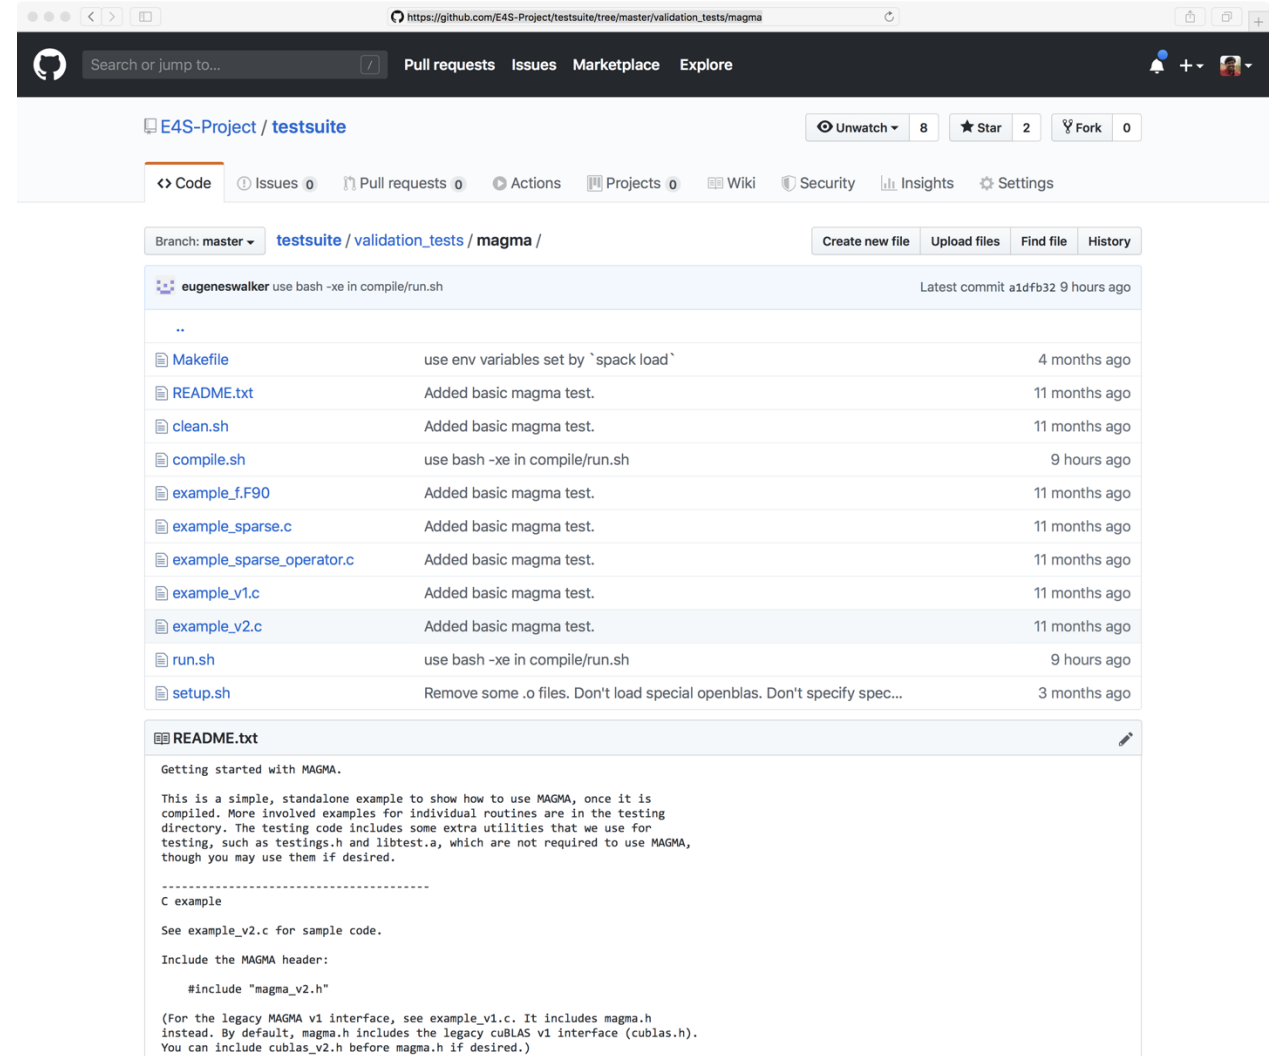

E4S Continuous Integration Testing

E4S Validation Test Suite

- Provides automated build and run tests
- Validate container environments and products
- New LLVM validation test suite for DOE LLVM

The screenshot shows the GitHub repository page for `E4S-Project/testsuite`. The repository is on the `master` branch. The file list shows the following files and their commit dates:

File	Description	Commit Date
..		
Makefile	use env variables set by `spack load`	4 months ago
README.txt	Added basic magma test.	11 months ago
clean.sh	Added basic magma test.	11 months ago
compile.sh	use bash -xe in compile/run.sh	9 hours ago
example_f.F90	Added basic magma test.	11 months ago
example_sparse.c	Added basic magma test.	11 months ago
example_sparse_operator.c	Added basic magma test.	11 months ago
example_v1.c	Added basic magma test.	11 months ago
example_v2.c	Added basic magma test.	11 months ago
run.sh	use bash -xe in compile/run.sh	9 hours ago
setup.sh	Remove some .o files. Don't load special openblas. Don't specify spec...	3 months ago

The `README.txt` file content is as follows:

```
Getting started with MAGMA.

This is a simple, standalone example to show how to use MAGMA, once it is
compiled. More involved examples for individual routines are in the testing
directory. The testing code includes some extra utilities that we use for
testing, such as testings.h and libtest.a, which are not required to use MAGMA,
though you may use them if desired.

-----
C example

See example_v2.c for sample code.

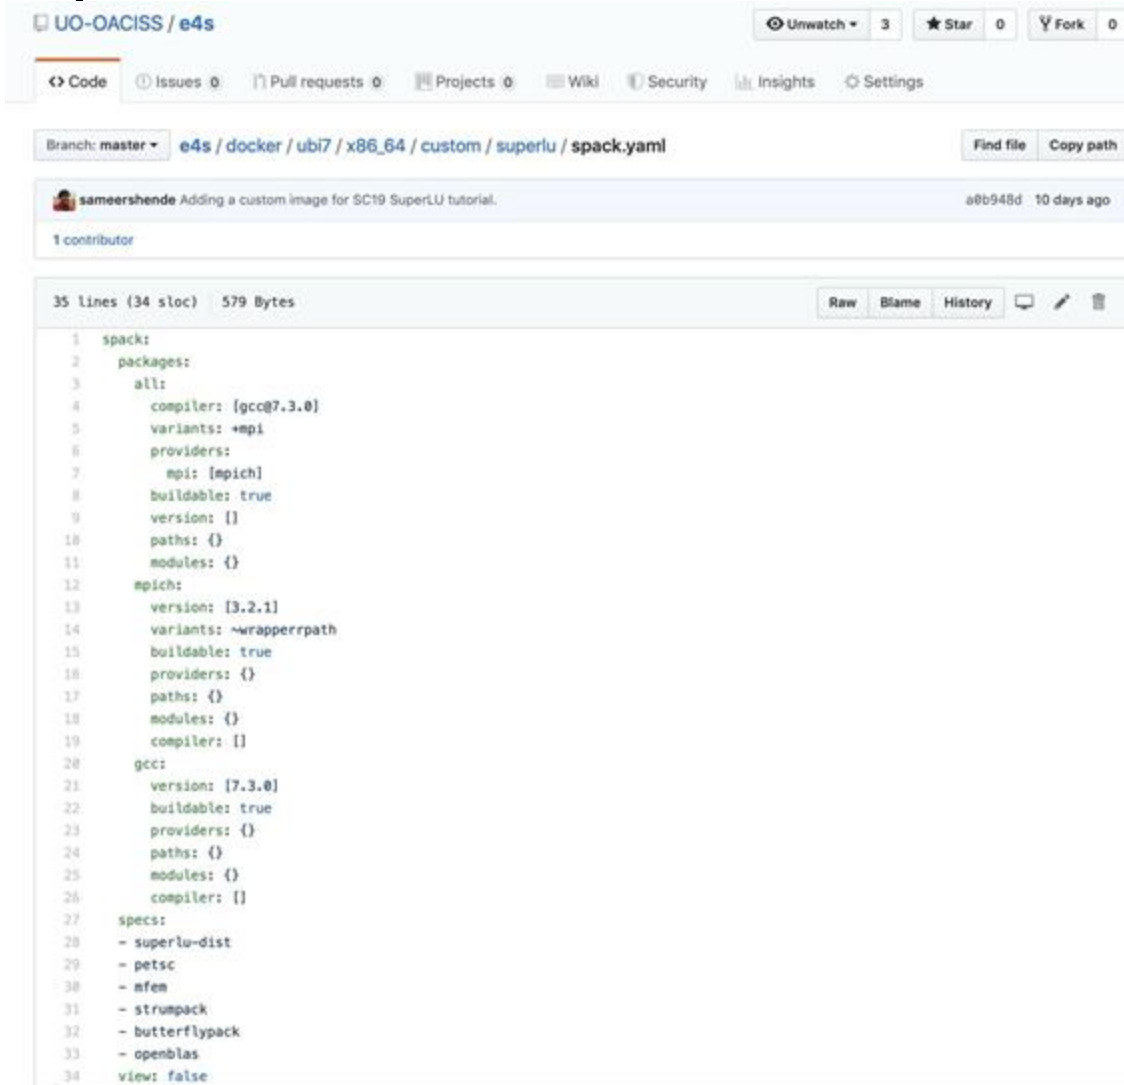

Include the MAGMA header:

#include "magma_v2.h"

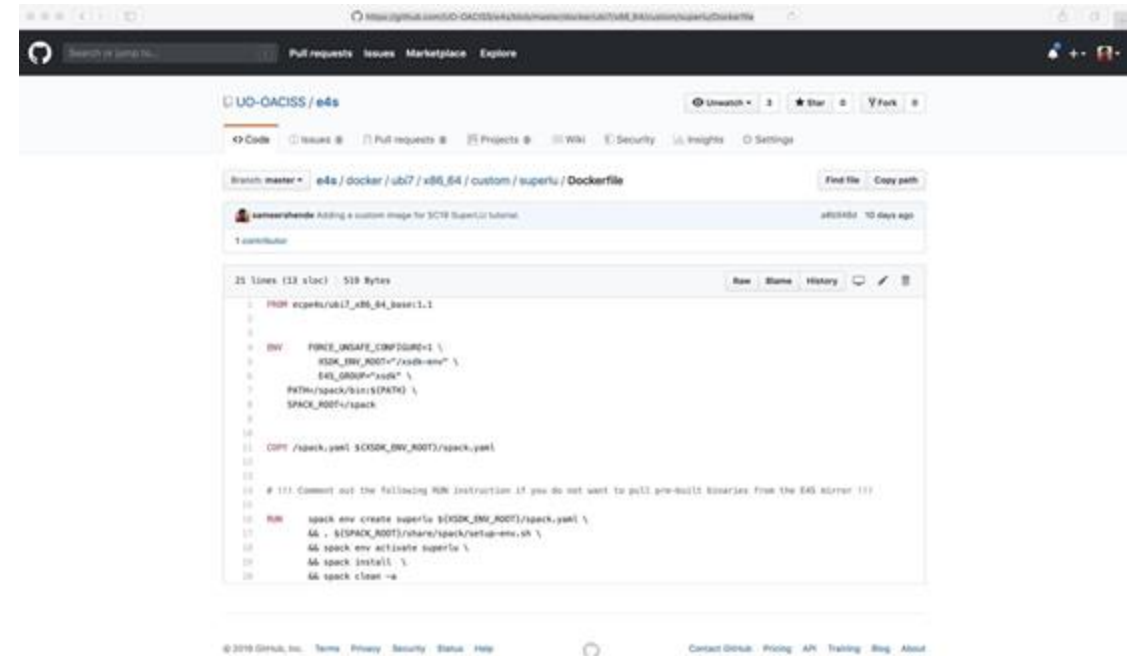

(For the legacy MAGMA v1 interface, see example_v1.c. It includes magma.h
instead. By default, magma.h includes the legacy cuBLAS v1 interface (cublas.h).
You can include cublas_v2.h before magma.h if desired.)
```

- git clone <https://github.com/E4S-Project/testsuite.git>

15     && spack install \
16     && spack clean -e
```

- PMR SDK base image has Spack build cache mirror and GPG key installed.
- Base image has GCC and MPICH configured for MPICH ABI level replacement (with system MPI).
- **Customized container build using binaries from E4S Spack build cache for fast deployment.**
- **No need to rebuild packages from the source code.**
- Same recipe for container and native bare-metal builds with Spack!

E4S: GitLab Runner Images

The screenshot shows the Docker Hub interface with search filters for 'ecpe4s' and 'ppc64le'. A list of seven Docker images is displayed, each with its name, update time, scan status, star count, download count, and visibility.

Image Name	Updated	Not Scanned	Stars	Downloads	Visibility
ecpe4s / ubuntu18.04-e4s-gpu-ppc64le	Updated an hour ago	Not Scanned	0	61	Public

E4S Community Engagement

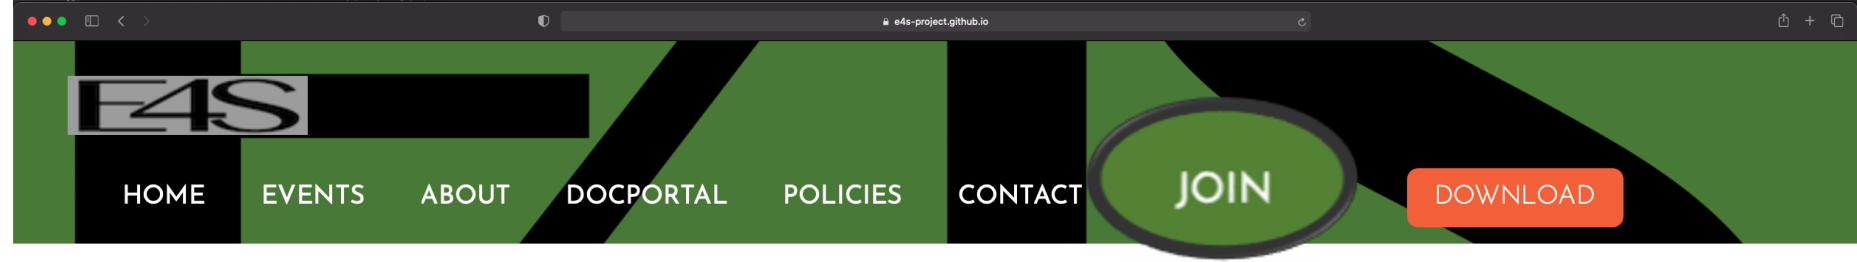

Opportunities via E4S

- E4S enables portfolio strategy for ASCR R&D software delivery:
 - Facilities: Robust planning, delivery, integration and testing at Facilities
 - Community: MPI Forum, C++, OpenMP, LLVM
 - Vendor: Coordinated integration into vendor software stacks
 - Users: Turnkey delivery of capabilities to DOE program offices, US agencies, industry, international partners
- E4S provides incentives and support for high-quality research software products
 - Community policies: Drives quality by explicit expectations and clear view of gaps
 - SDKs for community interaction: Build awareness and collaboration across independent teams
 - Transparency: E4S DocPortal, build, test, integration shows quality (good or poor) of a product
- E4S provides direct path for software teams to reach users and other stakeholders
 - Example: ArborX is brand new geometric search library
 - Part of E4S, available at DocPortal, tested regularly on many platforms
 - Installed anywhere E4S is installed, users can count on it being there
 - Without E4S: ArborX would take years to become visible and available
 - Availability and adoption timeline reduced from years (or never) to months

Joining E4S

- Process:
- Pre-req: Must make sense
- L0: E4S Spackified
- L1: Listed in DocPortal
- L2: Satisfy policies

E4S represents a growing community of HPC software products. Please [contact us](#) if you would like your product to be a part of E4S.

Pre-requisite: Justification for being included. The product must have some value or strong potential value to the HPC community. In other words, it must make sense for the product to belong to E4S.

Level 0: Be listed in the E4S Spack installation script and be buildable in all E4S target environments. The list of Spack recipes for E4S is [here](#).

Level 1: Be present in the [DocPortal](#). To achieve this, we need a URL to your main repo to add to [this list](#).

Level 2: Satisfy all E4S [community policies](#). Full satisfaction is not required at this time. We are still establishing a process. Note that derived requirements from E4S member packages are not required to satisfy community policies as long as they do not destabilize E4S builds or portability.

Broader Community Engagement

The Second Extreme-scale Scientific Software Stack Forum (E4S Forum)
September 24th, 2020, Workshop at EuroMPI/USA'20

- Presenters from 11 institutions, 6 non-DOE

E4S provides a natural collaboration vehicle for interacting within DOE, with other US agencies, industry and international partners

E4S summary

What E4S is not

- A closed system taking contributions only from DOE software development teams.
- A monolithic, take-it-or-leave-it software behemoth.
- A commercial product.
- A simple packaging of existing software.

What E4S is

- Extensible, open architecture software ecosystem accepting contributions from US and international teams.
- Framework for collaborative open-source product integration for ECP & beyond, including AI and Quantum.
- Full collection of compatible software capabilities **and**
- Manifest of a la carte selectable software capabilities.
- Vehicle for delivering high-quality reusable software products in collaboration with others.
- New entity in the HPC ecosystem enabling first-of-a-kind relationships with Facilities, vendors, other DOE program offices, other agencies, industry & international partners.
- Hierarchical software framework to enhance (via SDKs) software interoperability and quality expectations.
- Conduit for future leading edge HPC software targeting scalable computing platforms.

Looking Forward

Lessons learned from E4S/ECP ST to carry forward

- Deliver DOE reusable software as a portfolio
 - E4S value is already more than the sum of its parts
 - Community policies drive quality, membership
 - DocPortal, testing, containerization, cloud, build caches, modules, etc., greatly improve access & usability
 - Poor performing products are ID'ed, then improved or removed
- E4S is ready to extend to next-generation software and hardware needs
 - AI/ML products already in portfolio, ready for any new products
 - Quantum, FPGA, neuromorphic devices likely to be accelerators
 - From a macro software architecture, similar to GPUs
 - Software for these devices can and should be part of the same stack for holistic HPC environment
- DOE software as a portfolio is a first-class entity in the ecosystem
 - E4S planning, executing, tracking, assessing is peer collaboration with Facilities, program offices, vendors, etc
 - E4S can become a perennial asset for DOE/ASCR as part of its mission impact within and beyond DOE

E4S sustainability

Challenges

- ECP has a robust tailored 413.3b project management infrastructure
- Transitioning & adapting this infrastructure is essential for post-ECP success
- Funding models, portfolio management, org structure are particularly critical

Opportunities

- A sustainable software ecosystem for HPC software from DOE & broader community
- Payoff if done right: better, faster and cheaper – get all three

E4S Expansion – Base Scope & Gaps

Within base scope

Making a high-quality HPC product portfolio through tools, processes, and transparency

Community policies: Improve product quality upstream, shepherd membership growth

DocPortal: Provide easy access to product documentation

Portfolio testing: Protecte against regressions, prepare for new platforms

Curated collection: Maintain version compatibility across products

Turnkey stack via quarterly releases: Provide functionality via Spack, containers, clouds

Gaps not in base

Features that are a significant departure from core mission needs

Sustained support of new customers (without specific collaborative funding)

Activities related to commercial software enterprise

Ongoing support of a maintenance-only product (no longer funded for R&D)

Need: Business models for the gaps

Final points

- E4S is a curated software stack with quality improvement incentives, moving toward turnkey use
- With DOE program managers ECP is starting
 - Software ecosystem sustainability planning
 - E4S strategic plan (will include monthly townhalls)
- We believe
 - E4S has reduced important gaps that limit usefulness of DOE software for industry
 - But some gaps remain
- Next steps:
 - Better characterize these gaps
 - Explore models to further reduce and close gaps
 - Plan and execute toward sustainability

Some opportunities for interactions

- E4S is ready for app teams to use now
 - Curated, version-managed collection of many libraries & tools app teams use
 - Turnkey builds, containers & cloud builds, Spack build cache: Can dramatically improve productivity
 - Full E4S suite available for non-GPU platforms (CPU-based clusters)
 - Many E4S product work on Nvidia GPUs, growing set of capabilities for Intel, AMD GPUs, some Arm/SVE
- Would love to engage new software teams
- Another opportunity:
 - 2021 Collegeville Workshop on Scientific Software – Software Teams
 - <https://collegeville.github.io/CW21/>
- Thank you!

ST Capability Assessment Report (CAR)

- Tiered discussion of ECP Software Technology structure, strategy, status and plans
- From high-level overview to details about each team's activities and next steps
- Produced about twice a year
- Includes gap analyses
- E4S scope updated for emerging needs

ECP-RPT-ST-0002-2020-Public

ECP Software Technology Capability Assessment Report-Public

Michael A. Heroux, Director ECP ST
Lois Curfman McInnes, Deputy Director ECP ST
Rajeev Thakur, Programming Models & Runtimes Lead
Jeffrey S. Vetter, Development Tools Lead
Sherry Li, Mathematical Libraries Lead
James Ahrens, Data & Visualization Lead
Todd Munson, Software Ecosystem & Delivery Lead
Kathryn Mohror, NNSA ST Lead

Thank you

<https://www.exascaleproject.org>

This research was supported by the Exascale Computing Project (17-SC-20-SC), a joint project of the U.S. Department of Energy's Office of Science and National Nuclear Security Administration, responsible for delivering a capable exascale ecosystem, including software, applications, and hardware technology, to support the nation's exascale computing imperative.

EXASCALE COMPUTING PROJECT

Thank you to all collaborators in the ECP and broader computational science communities. The work discussed in this presentation represents creative contributions of many people who are passionately working toward next-generation computational science.
